PUBLICAÇÕES CIENTÍFICAS

O Museu de Zoologia publica dois periódicos, *Papéis Avulsos de Zoologia* (previamente *Papéis Avulsos do Departamento de Zoologia da Secretaria de Agricultura de São Paulo*, iniciada em 1941) e *Arquivos de Zoologia* (previamente *Arquivos de Zoologia do Estado de São Paulo*, iniciada em 1940). Os artigos são publicados individualmente e trazem a data de recebimento e de aceite pela Comissão Editorial.

São derivados ambos os periódicos de documentos zoológicos da *Revista do Museu Paulista*, de forma que os volumes 1-3 de *Arquivos de Zoologia* englobam os volumes 24-26 da *Revista do Museu Paulista*. Com o estabelecimento de um periódico diferente para documentos zoológicos, a *Revista do Museu Paulista* foi reiniciada então como uma Nova Série, dedicado a assuntos não-zoológicos.

SCIENTIFIC PUBLICATIONS

The Museu de Zoologia publishes two journals, *Papéis Avulsos de Zoologia* (previously *Papéis Avulsos do Departamento de Zoologia da Secretaria da Agricultura de São Paulo*, started in 1941) and *Arquivos de Zoologia* (previously *Arquivos de Zoologia do Estado de São Paulo*, started in 1940). Papers are published as separate issues, which contain the dates of receipt and acceptance by the Editorial Committee.

Both journals are derived from zoological papers in the *Revista do Museu Paulista*, so that volumes 1-3 of *Arquivos de Zoologia* bear volumes numbers 24-26 of *Revista do Museu Paulista*. With the establishment of a different journal for zoological papers, the *Revista do Museu Paulista* was then restarted as a New Series, dedicated to non-zoological subjects.

PUBLICACIONES CIENTÍFICAS

El Museu de Zoología publica dos periódicos, *Papéis Avulsos de Zoología* (previamente *Papéis Avulsos do Departamento de Zoología da Secretaria de Agricultura de São Paulo*, que inició en 1941) y *Arquivos de Zoología* (previamente *Arquivos de Zoología do Estado de São Paulo*, que inició en 1940). Los artículos son publicados individualmente y contienen las fechas de recepción y aceptación por la Comisión Editorial.

Ambos periódicos se derivan de los artículos zoológicos de la *Revista do Museu Paulista*, de forma que los volúmenes 1-3 de *Arquivos de Zoología* llevan la numeración de los volúmenes 24-26 de la *Revista do Museu Paulista*. Con el establecimiento de un periódico diferente para los artículos de zoología, la *Revista do Museu Paulista* se reinició como una Nueva Serie, especializada en asuntos no relacionados con zoología.

GEOGRAPHIC DISTRIBUTION OF THE GENERA OF THE TRIBE ORYZOMYINI (RODENTIA: CRICETIDAE: SIGMODONTINAE) IN SOUTH AMERICA: PATTERNS OF DISTRIBUTION AND DIVERSITY

JOYCE R. PRADO^{1,2}
ALEXANDRE R. PERCEQUILLO^{1,3}

ABSTRACT

The Oryzomyini is the most diverse tribe of the sigmodontine (Cricetidae: Sigmodontinae) radiation, including 28 genera and about 130 species, with this diversity reflected in the ecological and morphological variation observed among members. There are many hypotheses to explain the emergence and diversification of the Sigmodontinae in South America, including areas of original differentiation (AOD). In this paper we provide information on the geographic distribution of all extant genera in the tribe Oryzomyini, organizing these data in a gazetteer that includes provenance (collection locality, state or province, country), elevation, and geographical coordinates. Distribution maps generated for all genera and species then serve as the starting point for testing patterns of geographic distribution and diversity, and especially the AOD hypothesis advocating origination in the northern Andes. Our results reveal considerable generic and specific richness and show that there are three general patterns of distribution, the Trans-Andean, Andean, and Cis-Andean. Moreover, different genera encompass distributions that are endemic, disjunct, or widely distributed, as well as those restricted by habitats in both forest and open areas. Recent phylogenetic hypotheses indicate that the distribution patterns of oryzomyines do not correlate with the major lineages of the inclusive clades; rather, each main lineage displays most of the biogeographic patterns described for the tribe as a whole. The northern Andes cannot be considered as AOD, since the most records for Oryzomyini are located in the Cis-Andes area. The northern Andes is the second region in number of species, while the Trans-Andean represents the third richest region in South America. Patterns of richness of the tribe are strongly concordant with several of the centers or regions of endemism described in the literature. Areas of high richness are located mainly in the Andes, followed in lesser degree by areas in the Guyanan Shield, Brazilian Atlantic and Amazon Forests, and Paraguayan Chaco.

KEY-WORDS: Oryzomyini; Geographic Distribution; AOD; Biogeography.

INTRODUCTION

The subfamily Sigmodontinae includes about 86 genera and 395 species (*sensu* Reig, 1980; Musser & Carleton, 2005), and is one of the most diverse and complex groups of New World mammals, representing about 29% of all Neotropical mammals (Weksler, 2006). Members of this subfamily are distributed mainly in South America, but some taxa are also found both in Central America and southeastern North America (Musser & Carleton, 2005). The current taxonomic concept of the Sigmodontinae and of the subordinate tribes, genera and species, is the result of the fundamental contribution provided by authors such as O. Thomas, J.A. Allen, G. Tate, W. Osgood, P. Hershkovitz, O. Reig, combined with extensive studies published in recent decades (Patton & Hafner, 1983; Carleton & Musser, 1989; Voss, 1991, 1993; Voss & Carleton, 1993; Smith & Patton, 1993, 1999; Musser *et al.*, 1998; Percequillo, 1998, 2003; Carleton & Olson, 1999; Patton *et al.*, 2000; D'Elía, 2003; D'Elía *et al.*, 2003; Weksler, 2003, 2006; Gómez-Laverde *et al.*, 2004; Musser & Carleton, 2005; Weksler *et al.*, 2006; Percequillo *et al.*, 2008, 2011).

Throughout history, sigmodontine genera have been grouped in 7 to 9 tribes (for a revision of the generic contents of these tribes, see Reig, 1984; Smith & Patton, 1999; and D'Elía *et al.*, 2007). However, for the last 15 years, morphological and molecular phylogenies have redefined and delimited those tribes (*e.g.*, Braun, 1993, Phyllotini; Voss & Carleton, 1993, Oryzomyini; Smith & Patton, 1993, 1999, all tribes; Steppan, 1995, all tribes; D'Elía *et al.*, 2003, 2005, 2006a, 2006b, 2007, Akodontini, Abrotrichini; Pacheco 2003, Thomasomyini; Weksler, 2003, 2006, Oryzomyini), causing reconsideration of their definition and contents (see D'Elía *et al.*, 2007), promoting the following tribal arrangement: Abrotrichini, Akodontini, Ichthyomyini, Oryzomyini, Phyllotini, Reithrodontini, Sigmodontini, Thomasomyini, Wiedomyini.

The Oryzomyini is the most diverse tribe among this large radiation, with 28 extant and about 130 species (Percequillo *et al.*, 2011; Weksler & Percequillo, 2011). The tribal diagnosis proposed by Voss & Carleton (1993) has been supported by studies employing phylogenetic methods (Steppan, 1995; Weksler, 2003, 2006; McCain *et al.*, 2007; Percequillo *et al.*, 2011), but hitherto published contributions have failed to provide adequate diagnoses for most of the genus-group taxa, or adequate information on the geographical distribution.

Despite these deficiencies, based on substantive advances in our understanding of the geographical

distribution, taxonomy and phylogenetic relationships, several authors have hypothesized the place and pattern of geographical diversification, as well as the time of origin and radiation patterns, of this group (Simpson, 1950, 1969; Hershkovitz, 1966, 1972; Patterson & Pascual, 1968, 1972; Savage, 1974; Baskin, 1978, 1986; Marshall, 1979; Reig, 1980, 1984, 1986; Jacobs & Lindsay, 1984; Slaughter & Ubelaker, 1984; Steppan, 1995; Engel *et al.*, 1998; Smith & Patton, 1999; Pardiñas *et al.*, 2002; Steppan *et al.*, 2004; Barros *et al.*, 2009; Valencia-Pacheco *et al.*, 2011).

Among the hypothesis erected to explain sigmodontine origin and diversification in South America, those presented by Hershkovitz (1962, 1966, 1972) were pivotal on the discussions regarding the habitat occupied by the ancestral lineage (or lineages) that invaded South America. Hershkovitz (1962, 1966, 1972) posited that the Oryzomyini was the most basal Sigmodontinae lineage, a group in his view that contained only forest-dwelling and pentalophodont taxa, at the base of an evolutionary transition to open, non-forested (or pastoral) habitats. This pathway was accompanied by the progressive reduction of the mesoloph/mesolophid, as the members of the Akodontini tribe, culminating in groups with derivative tetralophodont molars, inhabiting exclusively open habitats, like the Phyllotini. However, the contemporaneous definition of the Oryzomyini tribe (Voss & Carleton, 1993; Weksler, 2006; Weksler *et al.*, 2006; Percequillo *et al.*, 2011; Weksler & Percequillo, 2011) includes both traditional forest and pentalophodont taxa as well as several lineages of pastoral, tetralophodont sigmodontine genera, formerly allocated to other tribes, such as *Holochilus* (Sigmodontini), *Pseudoryzomys* (Phyllotini) and *Zygodontomys* (Akodontini). Thus, more recent phylogenetic hypotheses contradict the evolutionary scenario proposed by Hershkovitz (*op. cit.*). Importantly, and despite its importance in the definition and diagnosis of generic suprageneric groupings (Weksler & Percequillo, 2011), the evolutionary and adaptive importance of mesoloph (Hershkovitz, 1993) is still not fully understood. One of the reasons relates to the inadequate descriptions of geographic distribution and use of habitat (forest or open habitats) for several oryzomyine taxa.

Another important contribution on the origin and diversification in South America sigmodontines based on historic events is the Area of Original Differentiation (AOD) hypothesis proposed by Reig (1984; further elaborated in 1986). This model advocates for the existence of areas where sigmodontine taxa experienced their main differentiation; for the Oryzomyini, the AOD was posited to be the humid forests of the

northern Andes. From this area, extending from the Ecuadorean-Peruvian border northeast to the Colombian/Venezuelan border, oryzomyines subsequently dispersed to other forested areas in South America. One merit of Reig's work (1984, 1986), in addition to the recognition of general areas of original differentiation, was the delineation of areas of greatest generic and species diversity, as well as the description of distribution patterns throughout the Andes for several groups of rodents. Nevertheless, identification of areas of endemism for Sigmodontinae taxa, similar to those proposed by Cracraft (1985) for the avifauna of South American, has remained incomplete. Cracraft, employing abundant literature on bird geographic distributions and a well-defined concept of endemism, identified 33 areas of endemism in South America, including endemic species of each. It is likely that the minimal advance in the recognition of areas of endemism for sigmodontine rodents has resulted from poor knowledge of both the taxonomy and geographic distribution for most species.

Recently, Valencia-Pacheco *et al.* (2011) proposed an alternative, more ecological hypothesis to explain the diversification of the Oryzomyini tribe. These authors reported the existence of a latitudinal gradient in the number of species, with a marked decrease in diversity towards north and south, from the Amazon Basin. They also suggested the existence of a source-sink model, which would explain the patterns of diversity of the tribe, with the Amazon having served as a "source" (a kind of "center of origin" of the tribe) from which the oryzomyine species would disperse and colonize new environments.

Clearly, the central aspect to each and all scenarios and hypotheses aforementioned is the knowledge on the geographic distribution of the taxon studied. However, confident information on geographic distribution is still inadequate, with few contributions on this subject: several authors enlisted above aimed to explain origin and biogeography of sigmodontine rodents, even before establishing a sound basis on taxonomy and geographic distribution.

Therefore, we herein provide a comprehensive database for the collecting localities of oryzomyine genera, which in turn we used in both qualitative and quantitative analysis to fill gaps in our current knowledge of the geographic distribution and habitat use at the genus and species level. We also address the definition and validity of the Reig's Area of Original Differentiation for the Oryzomyini, under a modern systematic concept of the tribe. We furthermore address the identification of patterns of diversity, areas of greatest species richness, and areas of endemism for this clade in South America.

MATERIAL AND METHODS

Concepts and definitions

Terms like center of origin and endemism may be confusing, since their usage is broad and varied. In order to clarify and standardize such terms employed throughout the text, in this section we provide definitions for the most common concepts.

Area of Original Differentiation (AOD): according to Reig (1986), AOD is "the geographic space within which a give taxon experienced the main differentiation (cladogenesis) of its component taxa of subordinate rank". Despite some additional theoretical and conceptual reasoning that define an AOD [*e.g.*, "(1) it is the areas reached by the ancestral stock after its dispersal from the AOD of its parental taxon; (2) it is the area where the taxon split most actively into subordinate taxa, acquiring through this process its defining properties; (3) it is the area in which the taxon split into apomorphic species, which dispersed into a new AOD to generate there a new sister taxon of the same rank"], Reig identified an AOD based on the number of records and number of endemic taxa in a given area (see areas on material and methods section). In 1986, there were no available phylogenies for the tribe or subfamily that would allowed Reig to apply any of his criteria to recognize an AOD for any tribe of Sigmodontinae.

Center of Origin: this is one of the most prevalent yet controversial concepts permeating biogeographic analyses, and as a consequence its definition varies widely, including but not exclusive of: birthplace, place where the most derived forms reside, or area with the greatest number of species. Cain (1944) defined several criteria to recognize centers of origin, some of them very similar to those employed by Reig in his recognition of an AOD, namely the location of greatest differentiation of a type, and location of dominance or greatest abundance of individuals. Despite the similarity among these terms, we follow Reig (1986) and consider them as distinct, with the proviso that the AOD concept explicitly includes historical and evolutionary aspects on its definition.

Area or Center of Endemism: Cracraft (1985:50) considers areas of endemism as "regions defined by distributional congruence of the constituent taxa. The simplest hypothesis is that areas of endemism represent common regions of biotic differentiation. Phylogenetic histories of taxa endemic in three or

more areas provide evidence for their historical inter-relationship, and it is these hypotheses regarding the history of areas that allow us to investigate patterns of differentiation in the component taxa". Cracraft (1985:53) further stated "areas of endemism are defined by discrete (diagnosable), differentiated taxonomic units". Harold & Mooi (1994) and Morrone (1994) presented a similar definition, which is an area identified by the congruence of distributional boundaries of two or more species, where congruence does not demand complete agreement on those limits at all possible scales of mapping, but relatively extensive sympatry is a prerequisite.

Species richness: number of species in a sample from a local area or geographic region, also referred to as alpha diversity (Lomolino *et al.*, 2009). We aimed to identify patterns of diversity/richness throughout South America, at both the specific and generic levels, for members of the tribe Oryzomyini in different areas and/or habitats across the continent.

We also provide definitions for other terms currently employed herein, especially those identifying types of vegetation and habitats occupied by oryzomine species.

Dry diagonal: a belt that bisects cis-Andean South America diagonally from northeastern Brazil to northern Argentina and Paraguay. Along this diagonal are distributed important vegetation types, such as Caatinga, Cerrado, and Chaco, usually drier and less mesic than the adjacent vegetation in the Atlantic Forest and Amazon Forest (Vanzolini, 1974).

Open areas: we include in our concept of open areas usually drier habitats as shrublands, periodically flooded savanna shrublands, tropical savannas, grasslands, seasonally flooded grasslands, which are typical habitats of Cerrado and Chaco, and also moorlands, montane grasslands (like the Andean Puna and Páramo), steppe vegetation (like the Argentinean, Uruguayan and Brazilian pampas), sparse vegetation, barren or bare soil, deserts (like the Peruvian Lomas), salt pans, and areas with permanent ice and snow (Eva *et al.*, 2002).

Forest or Forested areas: in this concept we include closed-canopy mesic and humid forests like evergreen broadleaf forests, evergreen broadleaf forests with bamboo dominance and semi-humid evergreen forests, typical of the Atlantic and Amazon Forests; more open, dry forests like deciduous and semi-deciduous tropical forest and semi-deciduous transition tropical

forest, typically observed in Cerrado (cerradão and gallery forests) and Caatinga; the flooded tropical forests like mangroves, periodically fresh water flooded tropical forests and permanently flooded forests; temperate forests like evergreen broadleaf temperate forests, evergreen mixed broad and needleleaf forests, and seasonal broadleaf forests; and finally Andean montane and elfin forests occurring between 500 m and 1,000 m and above 1,000 m of altitude, respectively (Eva *et al.*, 2002).

Sampling

We include information on the geographic distribution for all extant genera of the tribe Oryzomyini. Data on the collecting localities were obtained from multiple sources. For 13 genera (*Aegialomys*, *Cerradomys*, *Eremoryzomys*, *Euryoryzomys*, *Hylaeamys*, *Mindomys*, *Nephelomys*, *Oreoryzomys*, *Oryzomys*, *Pseudoryzomys*, *Transandinomys*, *Drymoreomys* and *Sooretamys*) we assembled data from specimens in the following institutional and personal collections: Museu de Zoologia da Universidade de São Paulo (MZUSP); Alexandre Uarth Christoff Collection (AUC); Museu Nacional da Universidade Federal do Rio de Janeiro (MNRJ); Laboratório de Mamíferos Aquáticos, Universidade Federal de Santa Catarina (LAMAQ); Museu de Ciências Naturais, Fundação Zoobotânica do Rio Grande do Sul (MCN); Museo Nacional de Ciencias Naturales "Bernardino Rivadavia" (MACN); Museo La Plata (MLP); Material collected by Maria Nazareth F. da Silva (MNFS), to be incorporated to the collections of Instituto Nacional de Pesquisas Amazônicas, Museu Paraense Emilio Goeldi and Museum of Vertebrate Zoology; Museu Paraense Emílio Goeldi (MPEG); Museum of Vertebrate Zoology, University of California (MVZ); Universidade Federal de Belo Horizonte (UFMG); Departamento de Sistemática e Ecologia da Universidade Federal da Paraíba (UFPB); Departamento de Genética da Universidade Federal do Rio Grande do Sul (UFRGS); Departamento de Zoologia da Universidade de Brasília (UNB); American Museum of Natural History (AMNH); Field Museum of Natural History (FMNH); material collected by Guillermo D'Elía (GE), to be deposited at the UMMZ; Instituto de Pesquisas Amazônicas (INPA); Museum of Natural History, Kansas University (KU); material collected by L.H. Emmons (LHE) to be deposited at the National Museum of Natural History; Museum of Zoology, Louisiana State University (LSUMZ); Museum of Comparative Zoology (MCZ); Royal Ontario Museum (ROM); Museum

of Zoology, University of Michigan (UMMZ); and National Museum of Natural History (USNM). For another group of 12 genera, as well as six of the taxa listed above, we obtained data from literature: *Amphinectomys* (Musser & Caleton, 2005); *Cerradomys* (Percequillo *et al.*, 2008; Tavares *et al.*, 2011); *Euryoryzomys* (Musser *et al.*, 1998); *Handleymys* (Voss *et al.*, 2002); *Hylaeamys* (Musser *et al.*, 1998); *Lundomys* (Voss & Carleton, 1993); *Melanomys* (Allen, 1913; Tate, 1932); *Microakodontomys* (Hershkovitz, 1993); *Microryzomys* (Carleton & Musser, 1989); *Neacomys* (Patton *et al.*, 2000; Voss *et al.*, 2001); *Nectomys* (Bonvicino, 1994); *Nesoryzomys* (Patton & Hafner, 1983); *Oryzomys* (Sánchez *et al.*, 2001; Voss & Weksler, 2009); *Pseudoryzomys* (Pardiñas *et al.*, 2004); *Sigmodontomys* (McCain *et al.*, 2007); *Scolomys* (Gómez-Laverde *et al.*, 2004); *Transandinomys* (Musser *et al.*, 1998); *Zygodontomys* (Voss, 1991). For three genera, *Holochilus*, *Oecomys* and *Oligoryzomys*, there is no available taxonomic review in the current literature. Although Hershkovitz had reviewed both *Holochilus* (1955) and *Oecomys* (1960), his taxonomic arrangement is obsolete; nevertheless, these papers provide important data on the geographical distribution. While these genera are well represented in Brazilian collections, without a reliable taxonomy we were unable to prepare a complete database (although we did employ information on the collection localities from museum databases through Manis system [<http://manisnet.org>]). Therefore, we exclude these three genera from our general conclusions on distribution and geographic diversity patterns.

Gazetteer and Mapping

Data on localities cited above were organized in gazetteers for each genus, which, in addition to the specific locality, contain geographic coordinates, elevation (when available), and all the species collected at the site. Gazetteers are organized in alphabetical order by country, state or province, and collection locality.

Geographic coordinates and elevation were obtained from several sources (Hershkovitz, 1948; US-BGN, 1955a, 1955b, 1956, 1957a, 1957b, 1961, 1963, 1964, 1968, 1969, 1976; Fairchild & Handley, 1966; Handley, 1976; Paynter Jr., 1982; 1989; 1992; 1993; 1997; Stephens & Traylor Jr., 1983, 1985; Voss, 1988; Paynter Jr. & Traylor Jr., 1991; VanZolini, 1992; Anderson, 1997) and also from <http://geonames.nga.mil/ggmagaz>. In general, it was difficult to recover the exact coordinates and elevation for many collecting points. Therefore, coordinates given

in gazetteers correspond to the nearest geographic place with the same name (town, river, municipality, range, etc.) mentioned in the above sources.

Maps were drawn to identify distribution patterns for each genus and its species. Besides the maps for the genera, we also mapped each of the tribal clades identified by Weksler (2006) and Percequillo *et al.* (2011) for the Oryzomyini onto the vegetation types identified by Eva *et al.* (2002). Finally, we produced maps exhibiting the abundance of records and depicting areas of species diversity of the Oryzomyini across South America.

South American regions

In order to evaluate which regions of South America are more diverse and exhibit higher levels of genus-group endemism, we divided the continent into separate areas. We followed Simpson (1975) and Reig (1986), and divided the Andes into 6 geographical unities, but unlike Reig (1986) we separated the non-Andean area in two units, Cis- and Trans-Andean. These Andean areas were also recognized as centers of endemism and well known areas of great species richness by Cracraft (1985). As our purpose is to evaluate Reig's AOD, we employed the same area delimitation to facilitate comparison of our respective results.

- (1) *North Andean (NA)*: all locations, in elevation above 1,000 m, north of the Huancabamba deflection in Peru through Ecuador, the three Andean cordillera in Colombia, the Sierra Nevada de Santa Marta in Colombia, and the Sierra Perija and Sierra de Mérida in Colombia and Venezuela;
- (2) *Center-North Andean (CNA)*: all locations in elevation above 1,000 m in Peru, south of the Huancabamba deflection north to 15°S south;
- (3) *Center-South Andean (CSA)*: all locations in elevation above 1,000 m between 15°S and 25°S from southern Peru through Bolivia to northern Chile and northwestern Argentina.
- (4) *North-South Andean (NSA)*: all locations in elevation above 1,000 m, along the main Andean axis (excluding the Balcarce, Tandil and La Ventana Sierras), in northern and central Argentina and central Chile, between 25°S and 35°S.
- (5) *South of South Andean (SSA)*: all locations in elevation above 1,000 m, in the coastal cordillera of Chile, in the southern portion of Andean axis between 35°S and the southern portion of the Tierra Del Fuego.

- (6) *Trans-Andean (TA)*: all locations at elevations below 1,000 m and west of the Andean Cordillera.
- (7) *Cis-Andean (CA)*: all locations at elevations below 1,000 m and east of the Andean Cordillera.

Reig (1986) considered that every Cis- and Trans-Andean taxon should be assigned to a single non-Andean region, but his proposal has little practical value since there is a noticeable extra-Andean taxonomic diversity and geographic differentiation between the lowlands on both sides of the Andes. Therefore, for another set of analysis we also divided the Cis- and Trans-Andean regions into two main domains: the forested and the open formations, based on the map of the vegetation of South America (Eva *et al.*, 2002).

Beyond the geographical groupings, we also divided South America into elevational classes, with the intention of evaluating how generic diversity is organized altitudinally as well as horizontally. Although we were aware that species would not be confined to elevation classes and that altitudinal distribution depended upon the latitude, we used these classes (0-999 m, 1,000-1,999 m, 2,000-2,999 m, 3,000-3,999 m, above 4,000 m), in order to standardize the information and to evaluate which elevation zone exhibited more records for the tribe, fully aware that sampling artifacts may have biased our analyses. We also elaborated a diagram depicting the elevational range for every oryzomyine genera, allowing direct comparisons between these taxa.

Data analysis

We used every registered location estimate N_g , the total number of known geographical occurrences for each taxon. We then estimated the distributional frequency (f) for each taxon, in each one of the classes and unities (U), through the expression:

$$f_T \text{ in } U = \frac{\sum f_i \text{ in } U}{\sum N_{g_i}}$$

These data were organized in tables and, with the f_T distribution and the distribution maps, we estimated the Areas of Original Differentiation (AOD). We also counted the number of genera and species for each of the seven geographic areas, including the number of endemics for each taxonomic rank. Finally, we used the maps of record abundance and species richness to determine areas of greatest diversity across South America.

RESULTS AND DISCUSSION

The database

Geographic Distribution of Oryzomyini genera in South America

In this database we provide gazetteers of collecting localities, distributional maps, taxonomic content of each genus, data on habitat and summaries of geographical distribution for Oryzomyini genera and species.

Genus *Aegialomys* Weksler, Percequillo & Voss, 2006

Gazetteer

Ecuador

El Oro

1. 12 km E by road of Portovelo [ca. 792 m]. Not located; here are employed the geographical coordinates of Portovelo. *Aegialomys xanthaeolus*, 03°20'S, 79°49'W.
2. Pasage [ca. 61 m]. *Aegialomys xanthaeolus*, 03°20'S, 79°49'W.
3. Portovelo [ca. 610 m]. *Aegialomys xanthaeolus*, 03°43'S, 79°39'W.
4. Rio Pindo, Portovelo [ca. 564 m]. *Aegialomys xanthaeolus*, 03°50'S, 79°45'W.
5. Santa Rosa [ca. 31 m]. *Aegialomys xanthaeolus*, 03°27'S, 79°58'W.

Esmeraldas

6. Esmeraldas [sea level]. *Aegialomys xanthaeolus*, 00°59'N, 79°42'W.

Galápagos

7. Barrington Island (synonymous of Santa Fé Island). *Aegialomys galapagoensis*, 00°49'S, 90°04'W.
8. Chatham Island. Type locality of *Oryzomys galapagoensis*. *Aegialomys galapagoensis*, 00°50'S, 89°26'W.
9. James Island. *Aegialomys galapagoensis*, 00°14'S, 90°45'W.

Guayas

10. Cerro Manglaralto, Santa Elena (part of Sierra de Colonche) [ca. 365 m]. Not located; here are employed the geographical coordinates of Colonche. *Aegialomys xanthaeolus*, 02°00'S, 80°20'W.

11. Chongoncito, Guayaquil [ca. 365 m]. *Aegialomys xanthaeolus*, 02°14'S, 80°05'W.
12. Huerta Negra, 20 km ESE Balao, east of Tenguel. *Aegialomys xanthaeolus*, 03°00'S, 79°46'W.
13. Isla Puna, San Ramon, Guayaquil [ca. 925 m]. *Aegialomys xanthaeolus*, 02°50'S, 80°08'W.
14. Rio Chongón. 1.5 km SE Chongón [ca. 70 m]. *Aegialomys xanthaeolus*, 02°14'S, 80°04'W.
15. San Rafael, 7 km S Balao. *Aegialomys xanthaeolus*, 03°59'S, 79°47'W.

Loja

16. Alamor, San Agustin, Puyango [ca. 1,325 m]. *Aegialomys xanthaeolus*, 04°02'S, 80°02'W.
17. Amaluza. *Aegialomys xanthaeolus*, 04°36'S, 79°25'W.
18. Casanga River Valley [ca. 875 m]. Not located; here are employed the geographical coordinates of Rio Casanga. *Aegialomys xanthaeolus*, 04°08'S, 79°49'W.
19. Catacocho, Olmedo, Paltas [1,872 m]. *Aegialomys xanthaeolus*, 04°04'S, 79°38'W.
20. Hacienda Casanga, Paltas [884 m]. *Aegialomys xanthaeolus*, 04°01'S, 79°45'W.
21. Jatumpampa (used the coordinates of Jatum Pamba). *Aegialomys xanthaeolus*, 04°16'S, 79°42'W.
22. Loja. *Aegialomys xanthaeolus*, 04°00'S, 79°13'W.
23. Los Pozos, Macara. *Aegialomys xanthaeolus*, 04°23'S, 79°57'W.
24. Malacatos. *Aegialomys xanthaeolus*, 04°14'S, 79°15'W.
25. Sabiango, La Caprilla. *Aegialomys xanthaeolus*, 04°24'S, 79°52'W.

Los Ríos

26. Hacienda El Carmen, Vinces. Not located; here are employed the geographical coordinates of Vinces. *Aegialomys xanthaeolus*, 01°32'S, 79°45'W.
027. Hacienda Pijigual, Vinces. Not located; here are employed the geographical coordinates of Vinces. *Aegialomys xanthaeolus*, 01°32'S, 79°45'W.
28. Hacienda Santa Teresita (Abras de Mantequilla), ca. 12 km NE Vinces. Not located; here are employed the geographical coordinates of Vinces. *Aegialomys xanthaeolus*, 01°32'S, 79°45'W.
29. Vinces, near Puerto Nuevo and Vinces. *Aegialomys xanthaeolus*, 01°32'S, 79°45'W.

Manabí

30. Cuaque, Pedernales [sea level]. *Aegialomys xanthaeolus*, 00°00'S, 80°06'W.

31. Hacienda San Carlos, Bahia de Caraquez, Rio Briseño, Sucre [sea level]. *Aegialomys xanthaeolus*, 00°36'S, 80°25'W.

Pichincha

32. Great Quito Railroad, km 8. Not located; here are employed the geographical coordinates of Quito. *Aegialomys xanthaeolus*, 00°13'S, 78°30'W.

Peru**Amazonas**

33. 8 km WSW Bagua [ca. 457 m]. *Aegialomys xanthaeolus*, 05°40'S, 78°31'W.
34. Balsas, Chachapoyas [ca. 854 m]. *Aegialomys xanthaeolus*, 06°50'S, 78°01'W.

Ancash

35. 1 km N, 12 km E of Paracoto [ca. 2,590 m]. *Aegialomys xanthaeolus*, 09°31'S, 77°53'W.
36. 4 km by road NE Chasquitambo, km 51. Not located; here are employed the geographical coordinates of Chasquitambo. *Aegialomys xanthaeolus*, 13°48'S, 73°23'W.
37. Macate, Santa [ca. 2,712 m]. *Aegialomys xanthaeolus*, 08°46'S, 78°05'W.
38. Paracoto, Huaraz [ca. 1,239 m]. *Aegialomys xanthaeolus*, 09°32'S, 77°32'W.

Arequipa

39. 7.5 km E Acari. Not located; here are employed the geographical coordinates of Acari. *Aegialomys xanthaeolus*, 15°26'S, 74°37'W.
40. 13.5 km NNW Bella Union [ca. 731 m]. Not located; here are employed the geographical coordinates of Bella Union. *Aegialomys xanthaeolus*, 15°26'S, 74°39'W.
41. Chavina, on the coast near Acari, Rio Lemos, Province Caravelli. *Aegialomys xanthaeolus*, 15°37'S, 74°38'W.

Cajamarca

42. Cascas [ca. 1,274 m]. *Aegialomys xanthaeolus*, 07°29'S, 78°49'W.
43. El Arenal, Rio Huancabamba, 7 km, 50 km E, Olmos [ca. 915 m]. *Aegialomys xanthaeolus*, 05°59'S, 79°46'W.
44. Hacienda Limon, Celendin [ca. 2,048 m]. *Aegialomys xanthaeolus*, 06°50'S, 78°05'W.
45. Malca, Cajabamba [ca. 2,440 m]. *Aegialomys xanthaeolus*, 07°37'S, 78°03'W.
46. Rio Chamaya, 35 km SE San Felipe [ca. 762 m]. *Aegialomys xanthaeolus*, 05°46'S, 79°19'W.

Huánuco

47. Hacienda Buena Vista, Chinchao [ca. 1,066 m]. Not located; here are employed the geographical coordinates of Chinchao. *Aegialomys xanthaeolus*, 09°38'S, 76°04'W.

Ica

48. Hacienda San Jacinto, Ica. *Aegialomys xanthaeolus*, 14°09'S, 75°45'W.
 49. Hacienda San Pablo, El Ingenio, 30 km Nazca. Not located; here are employed the geographical coordinates of El Ingenio. *Aegialomys xanthaeolus*, 14°39'S, 75°05'W.
 50. San Javier, 13 km S Palpa [ca. 275 m]. *Aegialomys xanthaeolus*, 14°32'S, 75°11'W.

La Libertad

51. 5 km NE Pacasmayo [ca. 61 m]. *Aegialomys xanthaeolus*, 07°24'S, 79°34'W.
 52. Menocucho, Trujillo [ca. 500 m]. *Aegialomys xanthaeolus*, 08°01'S, 78°50'W.
 53. Pacasmayo [ca. 8 m]. *Aegialomys xanthaeolus*, 07°24'S, 79°34'W.
 54. Trujillo [ca. 34 m]. *Aegialomys xanthaeolus*, 08°07'S, 79°02'W.

Lambayeque

55. 2 km W Porculla Pass [ca. 1,981 m]. Not located; here are employed the geographical coordinates of Porculla Pass. *Aegialomys xanthaeolus*, 05°51'S, 79°31'W.
 56. 7.5 km N of Olmos [ca. 304 m]. Not located; here are employed the geographical coordinates of Olmos. *Aegialomys xanthaeolus*, 05°59'S, 79°46'W.
 57. 8 km S Morrope [ca. 304 m]. Not located; here are employed the geographical coordinates of Morrope. *Aegialomys xanthaeolus*, 06°33'S, 80°01'W.
 58. 19 km ENE Olmos [ca. 610 m]. Not located; here are employed the geographical coordinates of Olmos. *Aegialomys xanthaeolus*, 50°59'S, 79°46'W.
 59. Chongoyape, Chiclayo [ca. 209 m]. *Aegialomys xanthaeolus*, 06°46'S, 79°51'W.
 60. Hacienda El Carmen, Motupe [ca. 130 m]. *Aegialomys xanthaeolus*, 06°09'S, 79°44'W.
 61. Olmos [ca. 175 m]. *Aegialomys xanthaeolus*, 05°59'S, 79°46'W.

Lima

62. 7 km SSE Chilca [ca. 2 m]. Not located; here are employed the geographical coordinates

of Chilca. *Aegialomys xanthaeolus*, 12°32'S, 76°44'W.

63. 8 km SE Chilca [ca. 150 m]. Not located; here are employed the geographical coordinates of Chilca. *Aegialomys xanthaeolus*, 12°32'S, 76°44'W.
 64. 10 km ENE Pucusana [ca. 250 m]. Not located; here are employed the geographical coordinates of Pucusana. *Aegialomys xanthaeolus*, 12°29'S, 76°48'W.
 65. 1.5 km W Matucana [ca. 1,981 m]. Not located; here are employed the geographical coordinates of Matucana. *Aegialomys xanthaeolus*, 11°51'S, 76°24'W.
 66. 1.5 km W Surco [ca. 1,828 m]. Not located; here are employed the geographical coordinates of Surco. *Aegialomys xanthaeolus*, 11°52'S, 76°28'W.
 67. 8 km E Yanyos. Not located.
 68. Cerro Azul, Rio Cañete Valley [ca. 100 m]. *Aegialomys xanthaeolus*, 13°03'S, 76°30'W.
 69. Chosica [ca. 800 m]. *Aegialomys xanthaeolus*, 11°54'S, 76°42'W.
 70. Hacienda Casa Blanca, Cerro del Oro, Canete. Not located; here are employed the geographical coordinates of Canete. *Aegialomys xanthaeolus*, 13°04'S, 76°23'W.
 71. Lima [ca. 154 m]. *Aegialomys xanthaeolus*, 12°03'S, 77°03'W.
 72. Lomas de Lachay, 22 km N, 11 km W of Cancay [ca. 396 m]. *Aegialomys xanthaeolus*, 11°21'S, 77°23'W.
 73. Loma Viscachera. *Aegialomys xanthaeolus*, 12°31'S, 76°30'W.
 74. Santa Eulalia [ca. 1,036 m]. *Aegialomys xanthaeolus*, 11°51'S, 76°41'W.
 75. Santa Eulalia Cyn, 9.5 km NNE Chosica. Not located; here are employed the geographical coordinates of Santa Eulalia. *Aegialomys xanthaeolus*, 11°51'S, 76°41'W.
 76. Tornamesa. *Aegialomys xanthaeolus*, 11°54'S, 76°31'W.
 77. Vitarte. *Aegialomys xanthaeolus*, 12°02'S, 76°56'W.

Piura

78. Catacos. *Aegialomys xanthaeolus*, 05°16'S, 80°41'W.
 79. Chasquitambo, Julcan. *Aegialomys xanthaeolus*, 10°18'S, 77°36'W.
 80. Hacienda Bigotes, Morropón [ca. 200 m]. *Aegialomys xanthaeolus*, 05°19'S, 79°48'W.

81. Hacienda Mallares, Sullana. *Aegialomys xanthaeolus*, 04°53'S, 80°41'W.
82. Hacienda San Luis, La Arena. Not located; here are employed the geographical coordinates of La Arena. *Aegialomys xanthaeolus*, 05°20'S, 80°44'W.
83. Huancabamba [ca. 1,929 m]. *Aegialomys xanthaeolus*, 05°14'S, 79°28'W.
84. Laguna [ca. 1,150 m]. *Aegialomys xanthaeolus*, 04°41'S, 79°50'W.
85. Lancones, Sullana. *Aegialomys xanthaeolus*, 04°35'S, 80°30'W.
86. Las Trancas, Cerro Cortezo, Sullana. *Aegialomys xanthaeolus*, 04°53'S, 80°41'W.
87. Monte Grande, 14 km N, 25 km E of Talara. *Aegialomys xanthaeolus*, 04°28'S, 81°03'W.
88. Paymas, Ayabaca [ca. 700 m]. Coordinates of Ayabaca. *Aegialomys xanthaeolus*, 04°38'S, 79°43'W.
89. Piura [ca. 50 m]. *Aegialomys xanthaeolus*, 05°12'S, 80°38'W.

Tumbez

90. El Sauce. *Aegialomys xanthaeolus*, 07°06'S, 79°19'W.
91. Matapalo, Zarumilla [ca. 54 m]. *Aegialomys xanthaeolus*, 03°41'S, 80°12'W.
92. Positos, Zarumilla [ca. 25 m]. *Aegialomys xanthaeolus*, 04°16'S, 80°30'W.
93. Tumbez. Type locality of *Oryzomys xanthaeolus*. *Aegialomys xanthaeolus*, 03°34'S, 80°28'W.

Contents and Geographic Distribution: Currently the genus *Aegialomys* comprises only two species in the South American continent: *Aegialomys galapagoensis* (Waterhouse, 1839) and *Aegialomys xanthaeolus* (Thomas, 1894) (Fig. 1 and 2).

Aegialomys xanthaeolus is a species restricted to northern South America, with records in Northern Andes and North Central Andes, as well in Trans-Andean unity. This species inhabits mainly the arid montane areas of western Ecuador and Peru, and also the high elevations (about 2,500 m) in the upper Río Marañón valley of northern Peru. Most of these areas are covered by xerophytic vegetation, similar to other savanna-like landscapes in South America. However, in the coastal region of Peru and Ecuador this species is present in a type of arbustive-arbooreal vegetation, locally called "Lomas", located along the bottom of the valleys, due to the mist from the Pacific Ocean imprisoned on Occidental Andes slopes and to the most superficial water table in these areas (Hueck, 1972; Wolf, 1975). Altitudinally, *A. xanthaeolus* is widely

distributed throughout a wide range, occurring from 2 to 2,590 m above sea level (see Fig. 50).

Aegialomys galapagoensis is only found in the Trans-Andean region, being endemic to the Galapagos Archipelago, occurring only at the Chatham (San Cristóbal) and Barrington (Santa Fe) Islands. These islands are entirely volcanic in their composition, and the climate is extremely dry and although the sky is often clouded, rains are rare (Wolf, 1975). The vegetation in the lower part of the islands is represented mainly by large open areas covered only by thin and almost leafless bushes, and on the highest and central portion of the islands greener and moister vegetation can be found (Waterhouse, 1839).

Genus *Amphinectomys* Malygin, 1994

Gazetteer

Peru

Loreto

1. Província Requena, right bank of Rio Ucayali, 7 km E Henaro Errera, 04°55'S, 73°45'W.

Contents and Geographic Distribution: *Amphinectomys* has only one species, *Amphinectomys savamis* (Malygin, 1994), which is known only for the type locality, in the Peruvian Amazon Rainforest (Musser & Carleton, 2005; Weksler, 2006) (Fig. 3).

 160. Tacuati [Aca Poi]. *Cerradomys maracajuensis*, 23°27'S, 56°35'W.

San Pedro

161. Ganadera La Carolina, 1.5 km SW las casas. *Cerradomys maracajuensis*, 24°06'S, 56°25'W.

Peru**Puno**

162. Rio Heath, Águas Claras Camp [190 m]. *Cerradomys maracajuensis*, 12°57'S, 68°54'W.

Contents and Geographic Distribution: The genus *Cerradomys* inhabits predominantly open areas (grasslands and woodlands) and semideciduous forests, usually associated with the diagonal belt of open and drier vegetation formed by the Chaco, Cerrado, Pantanal, and Caatinga biomes (Bonvicino, 2003; Percequillo *et al.*, 2008). Throughout this distribution, there are also some species that occur peripherically associated with evergreen forests, especially on northeastern Brazil. The seven species currently recognized in the genus, *Cerradomys langguthi* (Percequillo, Hingst-Zaher & Bonvicino, 2008); *Cerradomys maracajuensis* (Langguth & Bonvicino, 2002); *Cerradomys marinhus* (Bonvicino, 2003); *Cerradomys subflavus* (Wagner, 1842); *Cerradomys vivoi* (Percequillo,

Hingst-Zaher & Bonvincino, 2008); *Cerradomys scotti* (Langguth & Bonvincino, 2002); and *Cerradomys goytaca* (Tavares, Pêssoa & Gonçalves, 2011), exhibit in general parapatric distributions, with some areas of sympatry between *C. scotti* and *C. maracajuensis*, *C. scotti* and *C. subflavus*, and among *C. scotti* and *C. marinhus* (Fig. 4 and 5).

Cerradomys langguthi is distributed on the left bank of Rio São Francisco, throughout the Brazilian states of Pernambuco, Paraíba, Ceará and Maranhão. According to Percequillo *et al.* (2008), in Pernambuco, Paraíba and Ceará, the distribution extends from the coastal lowlands to inland highlands and mountain ranges. Collection records in Maranhão are associated with lowlands of the central portion of the state. The known altitudinal range varies from 20 to 800 m.

Cerradomys maracajuensis is distributed across the Brazilian Cerrado from Minas Gerais, Mato Grosso do Sul and Mato Grosso to Paraguayan open areas. To the west, this species penetrates the open vegetation lowlands of Bolivia and Peru. According to Percequillo *et al.* (2008), most records are from lowlands although there are also records of specimens from highlands and dissected highlands of central South America, with altitudinal records ranging from 102 to 1,750 m.

Cerradomys marinhus has few records of collection, occurring mainly in grassland areas of the states of Goiás and Minas Gerais, from 700 to 800 m. On the other hand, *C. scotti* is widely distributed throughout central South America, with limits similar to those of the Cerrado biome. It is found from the Brazilian states of Piauí, Maranhão and Tocantins to the south-central state of Paraguarí in Paraguay. Similarly, it is also found across an east-west transect, from the eastern Brazilian state of Minas Gerais to eastern Bolivia. This species is geographically restricted to the central Brazilian highlands and several adjacent areas, being distributed from 100 to 1,000 m.

Cerradomys subflavus is found throughout the Brazilian states of Goiás, Minas Gerais and São Paulo. According to Percequillo *et al.* (2008) it is usually associated with the interior highlands in Minas Gerais and São Paulo, and with the Central Brazilian highlands in Goiás, and the known altitudinal range varies from 166 to 1,061 m.

Cerradomys vivoi inhabits the lowlands of the Brazilian states of Minas Gerais, Bahia and Sergipe.

Cerradomys goytaca inhabits the sandy plains of the northeastern littoral of Rio de Janeiro State and the southern littoral of Espírito Santo State, southeastern Brazil (Tavares, Pêssoa & Gonçalves, 2011).

Contents and Geographic Distribution: The genus *Eremoryzomys* is monotypic and the only species,

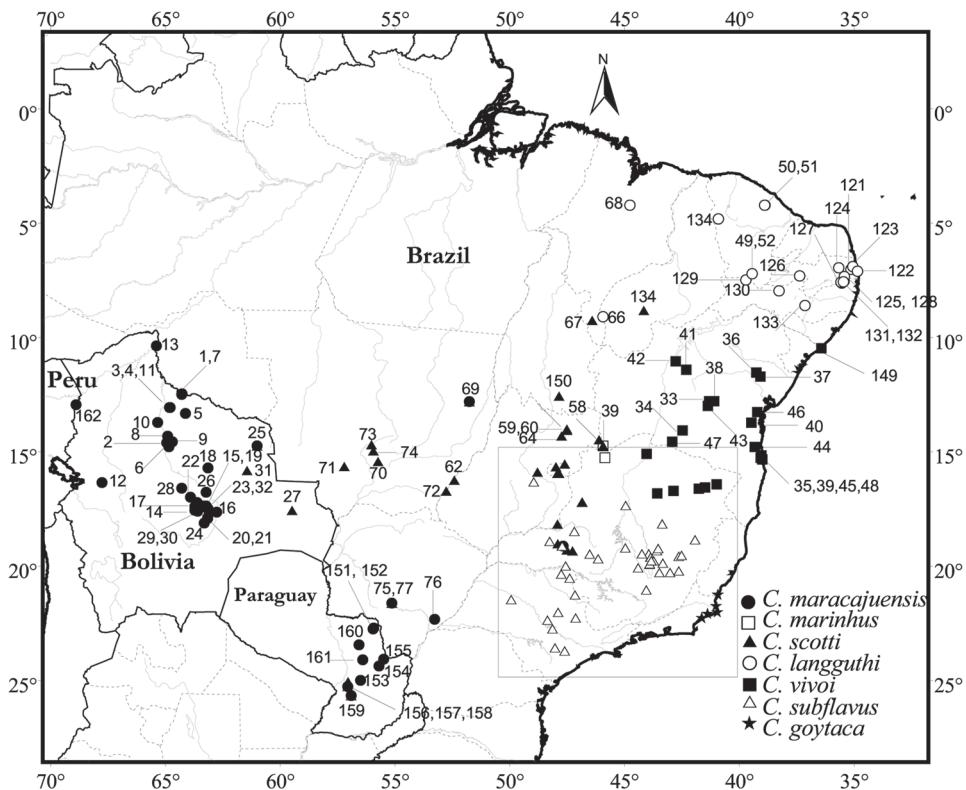

FIGURE 4: Map of known collecting localities of *Cerradomys* in Brazil, Paraguay, Bolivia and Peru. The number associated with each locality is the same used in the Gazetteer.

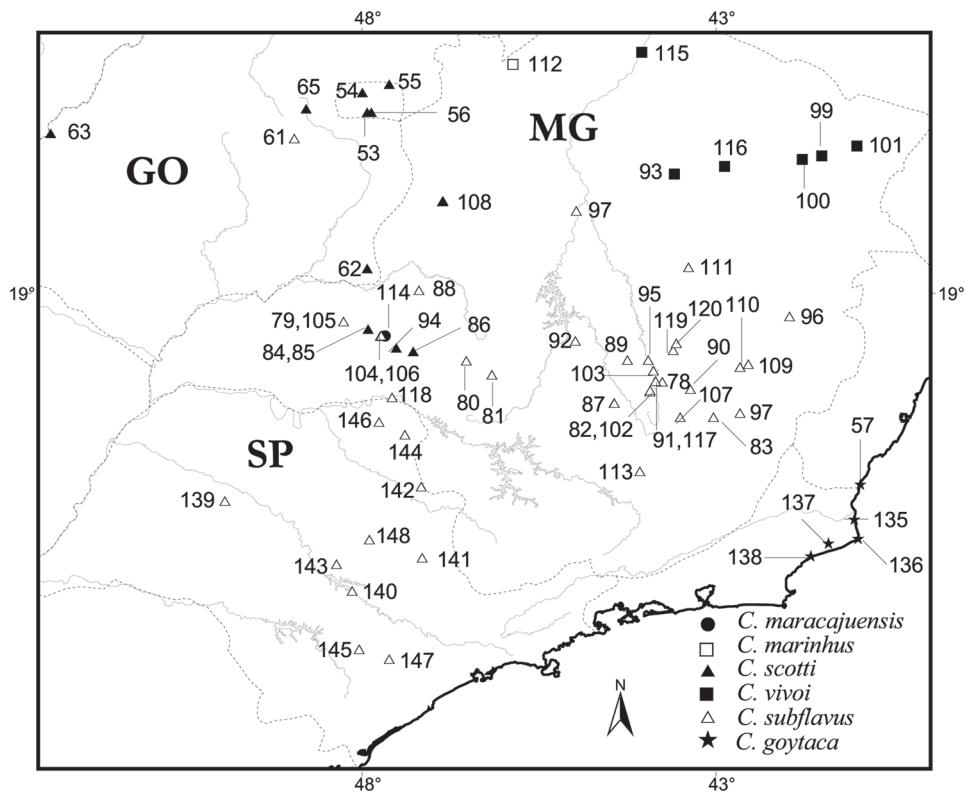

FIGURE 5: Detail of map showing localities for *Cerradomys*.

Eremoryzomys polius (Osgood, 1913), can be found in the upper Marañón valley of northern Peru. The few known localities are obtained in the dry and xerophytic vegetation found in this area (Fig. 7). See some comments on the geographic distribution of the genus in Percequillo *et al.* (2011).

***Euryoryzomys* Weksler, Percequillo & Voss, 2006**

Gazetteer

Argentina

Misiones

1. Parque Nacional Iguazú, Yacuí. Not located; we employed the geographic coordinates of Arroyo Yacuí. *Euryoryzomys russatus*, 25°35'S, 54°11'W.
2. Puerto Gisela [50 m]. *Euryoryzomys russatus*, 27°01'S, 55°27'W.
3. Serra de la Victoria, Departamento General Belgrano. *Euryoryzomys russatus*, 25°55'S, 54°00'W.

Jujuy

4. 2.9 km E El Palmar, Sierra Santa Bárbara. *Euryoryzomys legatus*, 24°05.27'S, 64°34.07'W.
5. 8.4 km E El Palmar, Sierra de Santa Bárbara. *Euryoryzomys legatus*, 24°07'S, 64°18'W.
6. El Simbolar, 25 k S Palma Sola. *Euryoryzomys legatus*, 23°59'S, 64°18'W.

Salta

7. 17 km SW beyond Dique Itiyuro, near Yacuiba [500 m]. *Euryoryzomys legatus*, 22°02'S, 63°45'W.
8. 24 km NW Água Blanca. *Euryoryzomys legatus*, 22°44'S, 64°22'W.
9. 27 km W Água Blanca, Departamento Orán. Not located; we used the geographic coordinates of San Ramón de la Nueva Orán. *Euryoryzomys legatus*, 23°08'S, 64°20'W.
10. Aguaray, FCCNA [700 m]. *Euryoryzomys legatus*, 22°16'S, 63°44'W.
11. Boca Santelmita, Parque Nacional Baritú (Santa Victoria, Parque Nacional Baritú, Arroyo Santelmita). Not located; we used the geographic coordinates of Arroyo Santelmita. *Euryoryzomys legatus*, 22°31'S, 64°37'W.
12. Naciente Arroyo Santa Rosa, Parque Nacional Baritú (Santa Victoria, Parque Nacional Baritú, Arroyo Santa Rosa). Not located; we used the geographic coordinates of Quebrada Santa Rosa. *Euryoryzomys legatus*, 22°37'S, 64°36'W.
13. Naciente Santelmita, Parque Nacional Baritú (Santa Victoria, Parque Nacional Baritú, Arroyo

Santelmita). Not located. See Boca Santelmita locality. *Euryoryzomys legatus*.

14. Piquirenda [700-800 m]. *Euryoryzomys legatus*, 22°20'S, 63°47'W.

Bolivia

Chuquisaca

15. 2 km E of Chuhuayaco [1,200 m]. *Euryoryzomys legatus*, 19°43'S, 63°51'W.
16. Montecantu, Provincia Tomina [1,985 m]. *Euryoryzomys legatus*, 19°31'S, 64°09'W.
17. Río Limón [1,300 m]. *Euryoryzomys legatus*, 19°33'S, 64°08'W.
18. Tihumayo, Provincia Tomina. *Euryoryzomys legatus*, 19°34'S, 64°08'W.
19. Tola Orko, 40 km of Padilla, Provincia Tomina [2,100 m]. Not located; we used the geographic coordinates of Padilla. *Euryoryzomys legatus*, 19°19'S, 64°20'W.

Cochabamba

20. 2 km E of Villa Tunari [300 m]. *Euryoryzomys nitidus*, 16°57'S, 65°23'W.
21. Misión San Antonio, Río Chimoré [400 m]. San Antonio del Chimoré, Río Chimoré, NE of Cochabamba. *Euryoryzomys nitidus*, 16°43'S, 65°07'W.

La Paz

22. Alcoche [558 m]. *Euryoryzomys nitidus*, 15°42'S, 67°40'W.
23. Guanay [427 m]. *Euryoryzomys nitidus*, 15°28'S, 67°52'W.
24. La Reserva [840 m]. *Euryoryzomys nitidus*, 15°44'S, 67°31'W.
25. Mapiri, above Río Beni [800 m]. 15°S, 68°W. Mapiri is located “acima Río Mapiri, 110 km NE do Lago Titicaca” (Paynter, 1993). *Euryoryzomys nitidus*, 15°15'S, 68°10'W.
26. Río Beni [250 m]. *Euryoryzomys nitidus*, 10°23'S, 65°24'W.

Beni

27. 6 km W Casarabe. *Euryoryzomys nitidus*, 14°54'S, 64°22'W.
28. 10 km NNE Riberalta, Río Beni, [Provincia] Vaca Diez. *Euryoryzomys nitidus*, 10°55'S, 66°03'W.
29. 45 km N (by road) of Yacuma [400 m]. *Euryoryzomys nitidus*, 14°42'S, 67°04'W.
30. Boca del Río Biata [170 m]. *Euryoryzomys nitidus*, 11°44'S, 66°47'W.

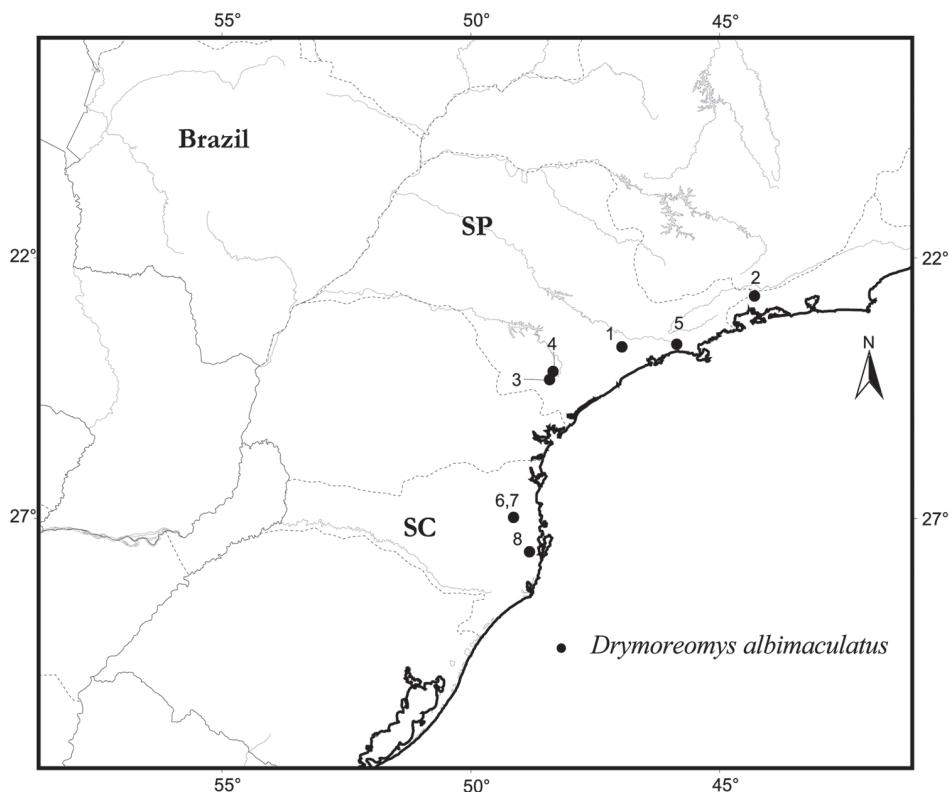

FIGURE 6: Map of collecting localities of *Drymoreomys* in Brazil. The number associated with each locality is the same used in the Gazetteer.

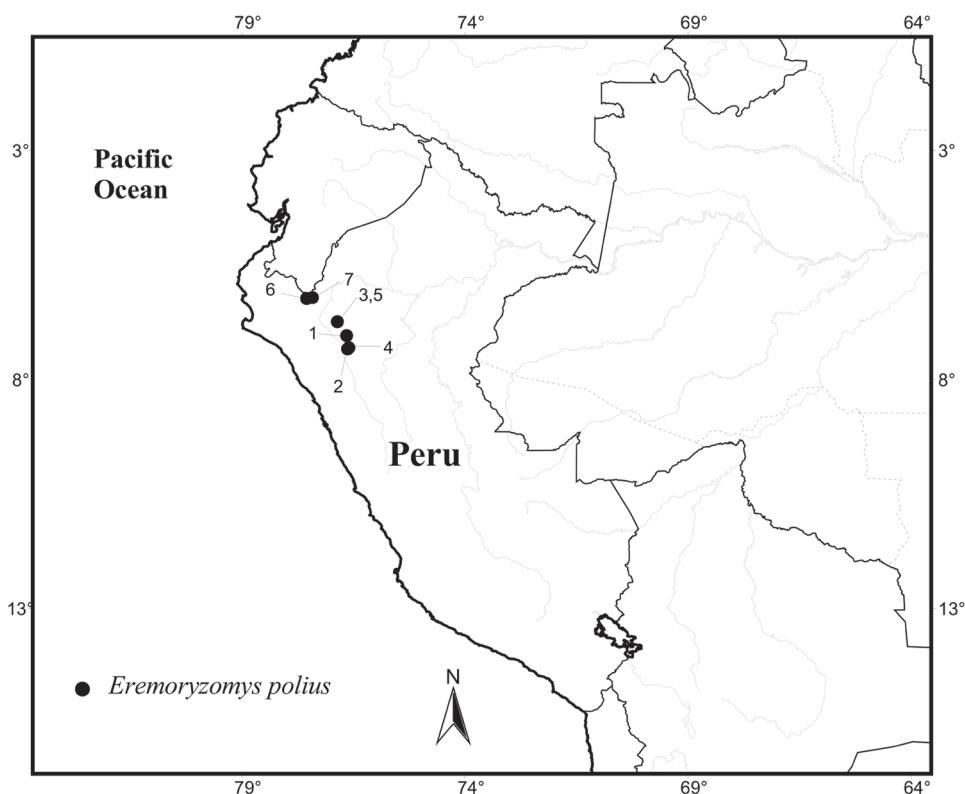

FIGURE 7: Map of collecting localities of *Eremoryzomys* in Peru. The number associated with each locality is the same used in the Gazetteer.

31. El Trapiche, Estação Biológica Beni, Província Yacuma [200 m]. *Euryoryzomys nitidus*, 14°48'S, 66°19'W.
32. Província de Moxos, 3.6 km NNE of San Ignacio de Moxos. *Euryoryzomys nitidus*, 14°51'S, 65°35'W.
33. Riberalta, Rio Beni, [Província] Vaca Diez. *Euryoryzomys nitidus*, 10°59'S, 66°06'W.
34. Rio Mamoré, 4 km NE mouth of Rio Grande. According to Anderson (1997), the correct collection locality is 5 km NW mouth of Rio Grande, Rio Mamoré. *Euryoryzomys nitidus*, 15°50'S, 64°41'W.
35. Rio Mamoré, Guayarmerin. *Euryoryzomys nitidus*, 10°48'S, 65°23'W.
36. Rurrenabaque. *Euryoryzomys nitidus*, 14°28'S, 67°34'W.
37. San Andres, Orobayaya, 60 km E San Joaquin. Not located; we used the geographic coordinates of Orobayaya. *Euryoryzomys nitidus*, 13°21'S, 63°45'W.
38. San Joaquin [200 m]. *Euryoryzomys nitidus*, 13°04'S, 64°49'W.

Santa Cruz

39. 1 km NE Estancia Las Cuevas, 101 km of Santa Cruz [1,300 m]. *Euryoryzomys legatus*, 18°11'S, 63°44'W.
40. 2 km SW of Las Cruces [480 m]. *Euryoryzomys nitidus*, 17°47'S, 63°22'W.
41. 3 km N, 13.5 km W San Rafael de Amboró, Rio Saguayo [400 m]. *Euryoryzomys legatus*, 17°34'S, 63°48'W.
42. 3.5 km W of Estación Pailón [300 m]. *Euryoryzomys nitidus*, 17°39'S, 62°47'W.
43. 4 km N, 1 km W of Santiago de Chiquitos [700 m]. *Euryoryzomys nitidus*, 18°18'S, 59°36'W.
44. 4.5 km N, 1.5 km E Cerro Amboró, Rio Pitatasama [620 m]. *Euryoryzomys nitidus*, 17°45'S, 63°40'W.
45. 6 km by road W de Ascención [= Ascención de Guarayos] [240 m]. *Euryoryzomys nitidus*, 15°43'S, 63°09'W.
46. 6 km N Buen Retiro [300 m]. *Euryoryzomys nitidus*, 17°13'S, 63°38'W.
47. 6 km W Santa Cruz. *Euryoryzomys nitidus*, 17°48'S, 63°14'W.
48. 7 km N Santa Rosa, Província Sara [800 m]. *Euryoryzomys nitidus*, 17°03'S, 63°35'W.
49. 8 km SE Tita [290 m]. *Euryoryzomys nitidus*, 18°28'S, 62°07'W.
50. 10 km N San Ramón [250 m]. *Euryoryzomys nitidus*, 16°36'S, 62°42'W.

51. 14 km NE San Ramón [540 m]. *Euryoryzomys nitidus*, 16°35'S, 62°25'W.
52. 54 km S boca del Chaparé, Rio Ichilo (right bank). *Euryoryzomys nitidus*, 16°29'S, 64°44'W.
53. Ayacucho [250 m]. *Euryoryzomys nitidus*, 17°00'S, 63°55'W.
54. ca. 2 km of la Boca del Rio Chapare, Rio Mamoré. *Euryoryzomys nitidus*, 15°57'S, 64°41'W.
55. Estância Cachuela Esperanza [300 m]. *Euryoryzomys nitidus*, 16°47'S, 63°14'W.
56. La Abra, 18 km NE Warnes, [Província] Warnes. *Euryoryzomys nitidus*, 17°23'S, 63°02'W.
57. Mataracú, Prov. Ichilo [380 to 420 m]. Not located; we used the geographic coordinates of Rio Mataracú, W Buena Vista [= Rio Maracara]. *Euryoryzomys legatus*, 17°36'S, 63°56'W.
58. Punta Rieles, Rio Yapacani. *Euryoryzomys nitidus*, 16°35'S, 64°12'W.
59. San Rafael de Amboró [400 m]. *Euryoryzomys nitidus*, 17°36'S, 63°36'W.
60. Santa Rosita, 3 km SW Warnes, [Província] Warnes *Euryoryzomys nitidus*, 17°32'S, 63°11'W.
61. Santiago de Chiquito, 46 km by road of Santo Corazón, 1 km N of Murcielago Camp Prov. Chiquito [ca. 400 m]. *Euryoryzomys nitidus*, 18°03'S, 59°01'W.
62. Warnes. *Euryoryzomys nitidus*, 17°30'S, 63°10'W.

Tarija

63. 1 km S of Camatindy [650 m]. *Euryoryzomys legatus*, 21°00'S, 63°23'W.
64. 3 km SE Cuyambuyo [900 m]. *Euryoryzomys legatus*, 22°16'S, 64°33'W.
65. 3 km WNW of Caraparí [850 m]. *Euryoryzomys legatus*, 21°48'S, 63°47'W.
66. 4 km by road N Cuyambuyo, Fábrica de Papel, Rio Sidras [980 m]. *Euryoryzomys legatus*, 22°13'S, 64°36'W.
67. 5 km NNW Entre Ríos [1,600 m]. *Euryoryzomys legatus*, 21°29'S, 64°12'W.
68. Caraparí [1,000 m]. Type locality of *Oryzomys legatus*. *Euryoryzomys legatus*, 21°49'S, 63°46'W.
69. N of Chiquiacá [990 m]. *Euryoryzomys legatus*, 21°50'S, 64°08'W.

Pando

70. Bella Vista [170 m]. *Euryoryzomys nitidus*, 11°23'S, 67°12'W.
71. Independência [170 m]. *Euryoryzomys nitidus*, 11°26'S, 67°34'W.
72. Isla Gargantúa [180 m]. *Euryoryzomys nitidus*, 12°23'S, 68°35'W.

73. La Cruz [170 m]. *Euryoryzomys nitidus*, 11°24'S, 67°13'W.
74. Palmira [180 m]. *Euryoryzomys nitidus*, 11°42'S, 67°56'W.
75. Rio Nareuda. *Euryoryzomys nitidus*, 11°17'S, 68°55'W.
76. Santa Rosa [180 m]. *Euryoryzomys nitidus*, 12°13'S, 68°24'W.

Brazil

Acre

77. Igarapé Porongaba, right bank of Rio Juruá. *Euryoryzomys nitidus*, 08°40'S, 72°47'W.
78. Manuel Urbano, Sena Madureira, BR 364, km 8. *Euryoryzomys nitidus*, 08°53'S, 69°18'W.
79. Seringal Oriente, near Vila Taumaturgo, Rio Juruá. *Euryoryzomys nitidus*, 08°48'S, 72°46'W.

Amapá

80. Macapá, Rio Amapari. *Euryoryzomys macconnelli*, 00°02'N, 51°03'W.
81. Serra do Navio [includes C3 and C5]. *Euryoryzomys macconnelli*, 00°59'N, 52°04'W.
82. Terezinha, Rio Amapari, Serra do Navio. *Euryoryzomys macconnelli*, 00°58'N, 52°02'W.

Amazonas

83. Barro Vermelho, left bank of Rio Juruá. *Euryoryzomys macconnelli*, 06°28'S, 68°46'W.
84. Condor, left bank of Rio Juruá. *Euryoryzomys macconnelli*, 06°45'S, 70°51'W.
85. Fazenda Esteio, reserva 1,301, ponto B15, 80 km N Manaus, INPA/WWF-US MCSE Project (PDBFF). *Euryoryzomys macconnelli*, 02°30'S, 60°00'W.
86. Foz igarapé Caititu, right bank of Rio Uatumá [= Igarapé Caititu, right bank of Rio Uatumá, near the mouth and right bank of Rio Uatumá, near mouth of Igarapé Caititu]. Not located; we used the geographic coordinates of Rio Uatumá. *Euryoryzomys macconnelli*, 02°35'W, 57°51'W.
87. Lago Vai Quem Quer, right bank of Rio Juruá. *Euryoryzomys macconnelli*, 03°19'S, 66°01'W.
88. Macaco, left bank of Rio Jaú. *Euryoryzomys macconnelli*, 02°05'01"S, 62°07'21"W.
89. Manaus. *Euryoryzomys macconnelli*, 03°08'S, 60°01'W.
90. Reserva 34 IS5, 80 km N Manaus, INPA/WWF-US MCSE Project (PDBFF). *Euryoryzomys macconnelli*, 02°25'S, 59°50'W.
91. Reserva 34 2R11, 80 km N Manaus, INPA/WWF-US MCSE Project (PDBFF). *Euryoryzomys macconnelli*, 02°25'S, 59°50'W.

Bahia

92. Almada, Rio do Braço, Ilhéus. Not located; we used the geographic coordinates of Rio do Braço. *Euryoryzomys russatus*, 14°41'S, 39°15'W.
93. Pirataquissé, Banco da Vitória, Ilhéus. Not located; we used the geographic coordinates of Vitória. *Euryoryzomys russatus*, 14°47'S, 39°06'W.
94. Ribeirão da Fortuna, Buerarema. Not located; we used the geographic coordinates of Buerarema. *Euryoryzomys russatus*, 14°56'S, 39°19'W.
95. Una, ESCAN. Not located; we used the geographic coordinates of Una, according to Percequillo (1998:306). *Euryoryzomys russatus*, 15°16'S, 39°04'W.
96. Urucutuca, Aritaguá, Ilhéus. Not located; we used the geographic coordinates of Aritaguá. *Euryoryzomys russatus*, 14°42'S, 39°05'W.

Ceará

97. IBAMA area, Hill behind Escola Municipal Granja, Pacoti, Serra de Baturité, CE. *Euryoryzomys* sp., 04°13'49"S, 38°55'02"W.
98. Guaraciaba do Norte [includes Sítio Benedito, Sítio Cacimba do Meio, Sítio Convento, Sítio Guarrancho, Sítio Mazagão, Sítio Rua Nova, Sítio São José, Sítio São Tomé, Sítio Tomé]. *Euryoryzomys* sp., 04°10'S, 40°45'W.
99. São Benedito [includes Sítio Barra, Sítio Cabeceria, Sítio Carangueijo do Pereira, Sítio Pimenteira, Sítio Queimadas dos Martins]. *Euryoryzomys* sp., 04°02'S, 40°52'W.
100. Sítio Corolero, Ibiapina. Not located; we used the geographic coordinates of Ibiapina. *Euryoryzomys* sp., 03°55'S, 40°54'W.
101. Sítio Friburgo, gruta do bananal, Pacoti, Serra de Baturité. *Euryoryzomys* sp., 04°14'S, 38°54'W.
102. Sítio Friburgo, gruta do cafezal, Serra de Baturité, Pacoti. *Euryoryzomys* sp., 04°13'S, 38°53'W.
103. Sítio Friburgo, Serra de Baturité, Pacoti. *Euryoryzomys* sp., 04°13'S, 38°54'W.

Espírito Santo

104. 3 km NE of Forno Grande, Castelo. *Euryoryzomys russatus*, 20°30'S, 41°06'W.
105. Estação Biológica de Santa Lúcia, 8.2 km Santa Teresa, Santa Teresa. *Euryoryzomys russatus*, 19°55'S, 40°31'W.
106. Fazenda Santa Terezinha, 33 km NE Linhares, Linhares. *Euryoryzomys russatus*, 19°12'S, 39°50'W.
107. Goipapoáçu (Goipaba-açu), Santa Teresa. *Euryoryzomys russatus*, 19°53'S, 40°28'W.

108. Reserva Florestal de Nova Lombardia, Santa Teresa. *Euryoryzomys russatus*, 19°53'S, 40°34'W.
 109. Santa Teresa. *Euryoryzomys russatus*, 19°56'S, 40°36'W.

Goiás

110. Anápolis. *Euryoryzomys lamia*, 16°19'S, 48°58'W.
 111. Fazenda Fiandeira, Parque Nacional de Chapada dos Veadeiros, 65 km SSW Cavalcante. *Euryoryzomys lamia*, 14°19'S, 47°45'W.

Mato Grosso

112. Serra do Roncador, 264 km N Xavantina [400 m]. *Euryoryzomys emmonsae*, 12°49'S, 51°46'W.

Mato Grosso do Sul

113. Urucum, 22 km S Corumbá. *Euryoryzomys nitidus*, 19°09'S, 57°38'W.

Minas Gerais

114. Fazenda Paraíso, Além Paraíba. Not located; we used the geographic coordinates of Além Paraíba. *Euryoryzomys russatus*, 21°51'S, 42°41'W.
 115. Lagoa Santa [760 m]. *Euryoryzomys russatus*, 19°37'S, 43°53'W.
 116. Passos. *Euryoryzomys russatus*, 20°42'S, 46°36'W.
 117. Rio Jordão, Araguari [700-900 m]. Type locality of *Oryzomys lamia*. *Euryoryzomys lamia*, 18°38'S, 48°11'W.

Pará

118. 26 km N and 30 km W of Marabá, near Itupiranga, Gleba 5, lote 5. *Euryoryzomys emmonsae* and *Euryoryzomys macconnelli*, 05°06'S, 49°24'W.
 119. 52 km SSW Altamira, Rio Xingú, [= Cachoeira do Espelho, rio Xingú]. Type locality of *Oryzomys emmonsae*. *Euryoryzomys emmonsae*, 03°39'S, 52°22'W.
 120. 54 km S, 150 km W of Altamira, Altamira (Gleba 61, Lote 02). *Euryoryzomys macconnelli*, 03°40'S, 52°45'W.
 121. 73 km N and 45 km W of Marabá (near Jatobá), Gleba 29, Lote 3. *Euryoryzomys macconnelli*, 04°41'S, 49°32'W.
 122. Capim [= São Domingos do Capim]. *Euryoryzomys macconnelli*, 01°41'S, 47°47'W.
 123. Capim [= São Domingos do Capim], BR 14, km 87. *Euryoryzomys macconnelli*, 02°06'S, 47°34'W.
 124. Capim [= São Domingos do Capim], BR 14, km 92. *Euryoryzomys macconnelli*, 02°09'S, 47°35'W.

125. Capim [= São Domingos do Capim], BR 14, km 93 and 94. *Euryoryzomys macconnelli*, 02°10'S, 47°35'W.
 126. Estrada Santarém-Cuiabá, BR165, km 216 (and km 217), Santarém. *Euryoryzomys emmonsae* and *Euryoryzomys macconnelli*, 04°09'S, 55°40'W.
 127. Flexal, Itaituba-Jacareacanga, km 212, Itaituba [includes Itaituba, Itaituba-Jacareacanga, km 213, Flexal]. *Euryoryzomys macconnelli*, 05°45'S, 57°23'W.
 128. Floresta Nacional Tapirapé-Aquiri, Marabá [Companhia Vale do Rio Doce, Carajás]. *Euryoryzomys emmonsae* and *Euryoryzomys macconnelli*, 05°48'S, 50°30'W.
 129. Igarapé-Assu. *Euryoryzomys macconnelli*, 01°32'S, 47°03'W.
 130. Itaituba. *Euryoryzomys macconnelli*, 04°17'S, 55°59'W.
 131. Monte Dourado. *Euryoryzomys macconnelli*, 00°52'S, 52°31'W.
 132. Rio Sacarazinho (km 7), Porto Trombetas, Oriximiná. Not located; we used the geographic coordinates of Porto Trombetas. *Euryoryzomys macconnelli*, 01°28'S, 56°24'W.
 133. Rodovia Transamazônica, km 19, Itaituba-Jacareacanga, Itaituba. *Euryoryzomys macconnelli*, 04°20'S, 56°10'W.
 134. Serra Norte, Marabá. Not located; we used the geographic coordinates of Marabá. *Euryoryzomys emmonsae* and *Euryoryzomys macconnelli*, 05°21'S, 49°07'W.
 135. S of Santarém, km 217 on the route 165 [0-100 m]. *Euryoryzomys macconnelli*, 04°00'S, 54°40'W.
 136. Utinga, Belém. *Euryoryzomys macconnelli*, 01°27'S, 48°29'W.

Paraíba

137. Mata de Pau Ferro, 6 km de Areia. Not located; we used the geographic coordinates of Areia. *Euryoryzomys* sp., 06°57'S, 35°41'W.

Rio Grande do Sul

138. Aratiba. *Euryoryzomys russatus*, 27°24'S, 52°19'W.
 139. Barracão. *Euryoryzomys russatus*, 29°19'S, 49°49'W.
 140. Lagoa do Jacaré, Torres. *Euryoryzomys russatus*, 27°40'S, 51°25'W.
 141. Morro do Osório, Osório. Not located; we used the geographic coordinates of Osório. *Euryoryzomys russatus*, 29°53'S, 50°16'W.
 142. São Nicolau, Fazenda Aldo Pinto. *Euryoryzomys russatus*, 28°10'S, 55°16'W.

143. Taquara do Mundo Novo [= Taquara], [29 m]. Type locality of *Hesperomys laticeps* var. *intermedia*. *Euryoryzomys russatus*, 29°39'S, 50°47'W.

Rio de Janeiro

144. Estrada Rio-Teresópolis. Probably Fazenda Guinle in Teresópolis, today called Granja Comary. *Euryoryzomys russatus*, 22°27'S, 43°00'W.
145. Ilha Grande [today Angra dos Reis]. According to Pinto (1945:277), the correct collection locality of *E. garbe* is Angra dos Reis. *Euryoryzomys russatus*, 23°00'S, 44°18'W.
146. Ilha Grande, 1 km W of Abraão. *Euryoryzomys russatus*, 23°08'S, 44°10'W.
147. Ilha Grande, Praia Vermelha. *Euryoryzomys russatus*, 23°09'S, 44°21'W.
148. Pedra Branca, Parati. *Euryoryzomys russatus*, 23°13'S, 44°43'W.
149. Santa Maria Madalena. *Euryoryzomys russatus*, 21°57'S, 42°01'W.

 243. Finisanti, Saramaca River. *Euryoryzomys macconnelli*, 05°08'N, 55°29'W.

Contents and Geographic Distribution: The genus *Euryoryzomys* inhabits the rainforests (evergreen and semi-evergreen) throughout the cis-Andean tropical and subtropical lowlands of South America, including Amazonia, the Guianas, southeastern Brazil, eastern Bolivia, northern Argentina, and eastern Paraguay (Fig. 8, 9 and 10). This genus is composed of six species: *Euryoryzomys emmonsae* (Musser *et al.*, 1998), *Euryoryzomys macconnelli* (Thomas, 1910), *Euryoryzomys lamia* (Thomas, 1910), *Euryoryzomys legatus* (Thomas, 1925), *Euryoryzomys nitidus* (Thomas, 1884), and *Euryoryzomys russatus* (Wagner, 1848), and an undescribed species from northeastern Brazil (Paraíba and Ceará).

Three species are associated with the Amazon Forest: *E. emmonsae*, *E. nitidus*, and *E. macconnelli*. The remaining three species are associated with different biomes or habitats of South America. *E. emmonsae* is known from only a few collection localities, inhabiting mostly the Amazon Forest of Para state. The known altitudinal range varies from 90 to 400 m.

Euryoryzomys nitidus occurs east of the Andes in Peru and in closely adjacent to parts of Brazil and Bolivia, inhabiting tropical and subtropical evergreen humid forest. According to Musser *et al.* (1998), compilation of habitat information shows that *E. nitidus* can be collected in primary forest formations, second-growth forest in various stages of regeneration, and from the tall shrubby ecotone between open fields and some kinds of forest structure. Altitudinally, *E. nitidus* is distributed from 170 to 971 m.

Collection localities of *E. macconnelli* are distributed in the lowlands of southern Colombia east of the Andes, south through Ecuador to southern Perú, and east through southern Venezuela, the Guiana region, and the Brazilian Amazon Basin. This species is typical

of the evergreen riverine forest (see Musser *et al.*, 1998). Elevation records extend from 10 to 1,372 m.

The species *E. russatus* is distributed throughout eastern South America: eastern Brazil, along the area originally covered by Atlantic Forest, from the state of Rio Grande do Sul to Bahia, northeastern Argentina and southern Paraguay. Data assembled by Musser *et al.* (1998) and Percequillo (1998) suggest that this species inhabits pristine or disturbed evergreen forests, but can also be found in the semideciduous forests and in gallery forests along major rivers that occur in the Cerrado Biome (as Teodoro Sampaio, Bauru and Lins, at São Paulo state). The known altitudinal range varies from sea level to 1,000 m.

Euryoryzomys legatus is associated with western South America: it occurs in southern Bolivia and northern Argentina, mostly living areas of the Yungas Forest at the foot of the Andes Mountains. Altitudinally, *E. legatus* is distributed from 380 to 2,800 m.

Euryoryzomys lamia is distributed in the central portion of South America: the few collection records can be found along the riverine forests and semideciduous forests of the Cerrado in the states of Goias and Minas Gerais in central Brazil. Elevation records extend from 700 to 1,010 m.

17. Municipio Pichindé, Finca la Playa on E slope of western Andes [1,800 m]. *Handleyomys fuscatus*, 03°27'N, 76°37'W.
18. Rio Pichindé, Peñas Blancas on E slope of western Andes [2,000 m]. *Handleyomys fuscatus*, 03°27'N, 76°43'W.
19. San Antonio on E slope of western Andes [2,134-2,438 m]. Type locality of *Handleyomys fuscatus*. *Handleyomys fuscatus* 03°30'N, 76°38'W.

Contents and Geographic Distribution: The genus *Handleyomys* presents two valid species, *Handleyomys fuscatus* (J.A. Allen, 1912) and *Handleyomys intectus*

(Thomas, 1921), both endemic to the North-Andean region, inhabiting the montane forests of the Andes in Colombia. The specimens of *H. fuscatus* are from the western Andes (Cordillera Occidental) and specimens of *H. intectus* are from the central Andes (Cordillera Central). However, according to Voss *et al.* (2002) they can also be found in semi-natural environments, mainly in pastures and agricultural areas associated with the remaining forest (Fig. 11). Elevation records extend from 1,700 to 2,743 m.

Contents and Geographic Distribution: Unlike most taxa, data for genus *Holochilus* was obtained from museum databases, without voucher specimen examination. Moreover, there is no recent published revision for the genus, which complicates correct nomenclatural assignment. Therefore, we employed data on genus level, and based on such information and on data available from the literature (Hershkovitz, 1955), *Holochilus* is widely distributed in lowland temperate and

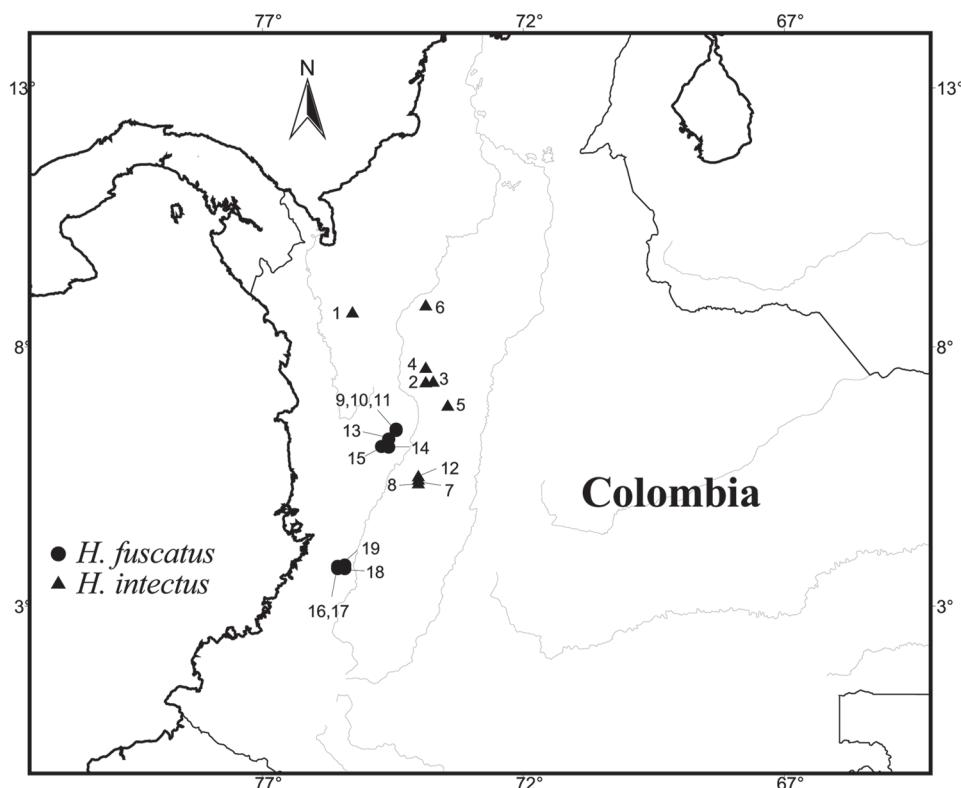

FIGURE 11: Map of collecting localities of *Handleyomys* in Colombia. The number associated with each locality is the same used in the Gazetteer.

202. Guaicaramo [600-700 m]. *Hylaeamys perenensis*, 04°43'N, 73°02'W.
203. Mámbarita. *Hylaeamys perenensis*, 04°46'N, 73°19'W.

Meta

204. El Parque La Macarena [Parque Nacional Natural La Macarena], 0.5 km W of Cabaña Duda [200 m]. *Hylaeamys perenensis*, 02°33'N, 74°02'W.
205. La Macarena [Serrania de], Pico Renjifo [1,372 m]. *Hylaeamys yunganus*, 03°06'N, 73°55'W.
206. Villavicencio [500 m]. *Hylaeamys yunganus*, 04°09'N, 73°37'W.

Putumayo

207. Rio Mecaya [185 m]. *Hylaeamys perenensis*, 00°28'N, 75°20'W.

Ecuador

Napo

208. Avila. *Hylaeamys perenensis*, 00°38'S, 77°25'W.
209. Laguna Grande, Rio Cuyabano [210 m]. *Hylaeamys perenensis*, 00°00'S, 76°11'W.
210. Limóncocha. *Hylaeamys perenensis*, 00°25'S, 76°38'W.
211. Llunchi [250 m]. *Hylaeamys yunganus*, 00°37'S, 76°46'W.
212. Río Suno Abajo. *Hylaeamys perenensis*, 00°48'S, 77°25'W.
213. San Francisco, Aguarico [200 m]. *Hylaeamys yunganus*, 00°30'S, 76°22'W.
214. San Jose Abajo [also spelled San José Nuevo; see Musser *et al.*, 1998] [250 m]. *Hylaeamys yunganus* and *Hylaeamys perenensis*, 00°26'S, 77°20'W.
215. San Jose de Payamino [300 m]. *Hylaeamys yunganus*, 00°30'S, 77°19'W.

216. Volcán Sumaco. *Hylaeamys yunganus*, 00°34'S, 77°38'W.

Pastaza

217. Río Capahuari, [see Musser *et al.*, 1998]. *Hylaeamys yunganus*, 01°55'S, 77°20'W.
218. Mera [1,140 m]. *Hylaeamys tatei*, 01°28'S, 78°08'W.
219. Río Tigre [305 and 610 m]. *Hylaeamys yunganus*, 02°07'S, 76°04'W.
220. Rio Yana Rumi [= Río Yanarumiyacu]. *Hylaeamys yunganus*, 01°38'S, 76°59'W.
221. Sarayacu. *Hylaeamys perenensis*, 01°44'S, 77°29'W.

Tungurahua

222. Mirador, 25 km E Baños [1,524 m]. *Hylaeamys tatei*, 01°26'S, 78°15'W.
223. Palmera [1,300 m]. Type locality of *Oryzomys tatei*. *Hylaeamys tatei*, 01°25'S, 78°12'W.

Zamora-Chinchipe

224. Zamora [991 m]. *Hylaeamys yunganus* and *Hylaeamys perenensis*, 04°04'S, 78°58'W.

French Guiana

Cayenne (Arrondissement)

225. Cacao [24 m]. *Hylaeamys yunganus* and *Hylaeamys megacephalus*, 04°35'N, 52°28'W.
226. Île de Cayenne, sea level [includes Rorota]. *Hylaeamys yunganus* and *Hylaeamys megacephalus*, 04°50'N, 52°20'W.
227. Kaw [100 m]. *Hylaeamys yunganus* and *Hylaeamys megacephalus*, 04°29'N, 52°02'W.
228. Paracou (Domaine Experimental Paracou), 15 km by road SSE Sinnamary and 5 km by road WNW Kourou [10-45 m]. *Hylaeamys megacephalus*, 05°17'N, 52°55'W.
229. Rio Arataye [30 m]. *Hylaeamys megacephalus*, 04°00'N, 52°40'S.
230. Säul. *Hylaeamys megacephalus*, 03°37'N, 53°12'W.

Guyana

Barima-Waini

231. Baramita, Old World. *Hylaeamys megacephalus*, 07°22'N, 60°29'W.
232. Kwabana. *Hylaeamys yunganus* and *Hylaeamys megacephalus*, 07°34'N, 59°09'W.
233. Santa Cruz. *Hylaeamys yunganus* and *Hylaeamys megacephalus*, 07°40'N, 59°14'W.
234. Waikerebi. *Hylaeamys megacephalus*, 07°31'N, 59°23'W.

Mazaruni-Potaro

235. Kartabu Point. *Hylaeamys megacephalus*, 06°23'N, 58°41'W.
236. Minehaha Creek [153 m]. *Hylaeamys megacephalus*, 05°08'N, 59°07'W.

Upper Takuku-Upper Essequibo

237. 50 km SWW Gunn's Strip, Rio Kamoá. *Hylaeamys megacephalus*, 01°32'N, 58°50'W.
238. 55 km SW Gunn's Strip, Rio Chodikar. *Hylaeamys megacephalus*, 01°22'N, 58°46'W.

Upper Demerara-Berbice

239. Georgetown. *Hylaeamys megacephalus*, 06°48'N, 58°10'W.

Potaro-Siparuni

240. 30 km NE Surama. *Hylaeamys megacephalus*, 04°20'N, 58°51'W.
241. 40 km SSW Hurupuhari (or Kurupuhari), Gorge Camp, Reserva Iwderama (or Iwohrama) [300 m]. *Hylaeamys megacephalus*, 04°20'N, 58°48'W.
242. Kabukalli, Floresta Iwokrama. *Hylaeamys megacephalus*, 04°17'N, 58°31'W.

Paraguay

Amambay

243. 4 km by road SW Cerro Corá. *Hylaeamys megacephalus*, 25°15'S, 55°59'W.
244. 28 km SW of Pedro Juan Caballero. *Hylaeamys megacephalus*, 22°43'S, 55°56'W.

Caaguazú

245. 22.5 km N Coronel Oviedo by road [Coronel Oviedo]. *Hylaeamys megacephalus*, 25°25'S, 56°27'W.

Canindeyú

246. 13.3 km N of Curuguaty, by road. Type locality of *Mus megacephalus*. *Hylaeamys megacephalus*, 24°22'S, 55°42'W.
247. Colônia Chupa Pou. *Hylaeamys megacephalus*, 24°09'S, 55°42'W.
248. Estancia Felicidad. *Hylaeamys megacephalus*, 24°09'S, 55°42'W.
249. Igatimi. *Hylaeamys megacephalus*, 24°05'S, 55°30'W.

San Pedro

250. Ganadera Jelvi, 1.8 km SE of las casas. *Hylaeamys megacephalus*, 24°07'S, 56°25'W.

251. Ganadera La Carolina, 745 m of las casas. *Hylaeamys megacephalus*, 24°05'S, 56°25'W.

Paraguarí

252. Tacuati, Aca Poi. *Hylaeamys megacephalus*, 23°27'S, 56°35'W.

Peru

Amazonas

253. Rio Santiago mouth. *Hylaeamys yunganus*, 04°27'S, 77°38'W.

254. Yambra, 10 m N de Corosha [1,982 m]. *Hylaeamys yunganus*, 05°50'S, 77°54'W.

255. Yambrasbamba [1,982 m]. *Hylaeamys yunganus*, 05°45'S, 77°54'W.

Ayacucho

256. San José, on Rio Santa Rosa [1,006 m]. *Hylaeamys yunganus*, 12°44'S, 73°46'W.

257. Santa Rosa, on Rio Santa Rosa [800 m]. *Hylaeamys yunganus*, 12°42'S, 73°44'W.

Cuzco

258. Cadena [1,000 m]. *Hylaeamys yunganus*, 13°24'S, 70°43'W.

259. Kiteni, Rio Urubamba. *Hylaeamys perenensis*, 12°20'S, 72°50'W.

260. Quincemil [680 m]. *Hylaeamys yunganus*, 13°16'S, 70°38'W.

261. Santa Ana [1,067 m]. *Hylaeamys yunganus*, 12°52'S, 72°43'W.

Huánuco

262. Cerros del Sira [1,120 m]. *Hylaeamys yunganus*, 09°28'S, 74°46'W.

263. Chinchao [1,738 m]. *Hylaeamys yunganus*, 09°38'S, 76°04'W.

264. Rio Chinchao, Hacienda Buena Vista [1,067 m]. *Hylaeamys yunganus*, 09°30'S, 75°56'W.

265. Rio Pachitea. *Hylaeamys yunganus*, 08°46'S, 74°32'W.

Junin

266. Amable María. *Hylaeamys perenensis*, 11°10'S, 75°10'W.

267. Perene [800 m]. Type locality of *Oryzomys perenensis*, 10°58'S, 75°13'W.

Loreto

268. Rio Curaray mouth [140 m]. *Hylaeamys yunganus*, 02°22'S, 74°05'W.

269. Huachi. *Hylaeamys yunganus* and *Hylaeamys perenensis*, 03°25'S, 76°20'W.

Madre de Dios

270. Reserva Cuzco Amazónico [200 m]. *Hylaeamys yunganus*, 12°33'S, 69°03'W.

Pasco

Sucre

311. Campo Alegre. *Hylaeamys megacephalus*, 10°10'N, 63°45'W.

Contents and Geographic Distribution: The genus *Hylaeamys* is widely distributed in South America (Fig. 13, 14, 15 and 16) and currently comprises seven species, namely: *H. acritus* (Emmons & Patton, 2005), *H. laticeps* (Lund, 1840), *H. megacephalus* (Fischer, 1814), *H. oniscus* (Thomas, 1904), *H. perenensis* (Allen, 1901), *H. tatei* (Musser *et al.*, 1998), and *Hylaeamys yunganus* (Thomas, 1902).

Hylaeamys megacephalus can be found in tropical evergreen rainforest formations throughout the Amazon Basin and semideciduous forests in southeastern Brazil and northern Paraguay, including riverine or gallery forest along the Brazilian Cerrado; this species has the largest known distribution of the genus. Altitudinally, *H. megacephalus* is distributed from 10 to 2,560 m (Jorge-Rodrigues, 2008).

Hylaeamys laticeps inhabits lowland tropical evergreen rain forest, occurring in the tropical and subtropical Atlantic rain forest of Brazil, from southern Bahia to northern Rio de Janeiro and reaching the eastern part of Minas Gerais. Altitudinally, *H. laticeps* is distributed from sea level to 600 m. Also in eastern Brazil, *H. oniscus* inhabits the tropical Atlantic rain forest from Paraíba to Alagoas, from 28 to 60 m of altitude (Brennand, 2010).

The Amazon Basin harbors the four remaining species. *H. acritus*, is distributed in eastern Bolivia on the basin of the Guaporé River, occurring in a mosaic of humid, semi deciduous and deciduous forests and liana forests, wet and dry savanna and Cerrado formations. *H. perenensis*, inhabits the western portion of the Amazon Forest in Bolivia, Brazil, Peru, Ecuador and Colombia. This species is probably limited to the western margin of Rio Madeira, inhabiting mature and disturbed Várzea and Terra Firme forests (see also Patton *et al.*, 2000; Emmons & Patton, 2005), but the limit on the north bank of Rio Amazonas is still unknown. *H. tatei* is restricted to few localities on the eastern slope of the Ecuadorean Andes, at the montane Andean forests. *H. yunganus* is distributed throughout the Amazon Basin, with records from

7. Rio Olimar Chico, 25 km WSW Trienta y Tres, 33°14'S, 54°51'W.

Contents and Geographic Distribution: The genus *Lundomys* includes only one species, *Lundomys molitor* (Winge, 1887). The genus is known from the fossil record of Lagoa Santa, Minas Gerais (Brazil). Records of extant specimens are from southern South America, predominantly from Uruguay (on the Brazilian/Uruguayan border), inhabiting grasslands, marshes, gallery forests, and open woodlands. This is a complex mosaic of subtropical pampas habitats (Voss & Carleton, 1993) (Fig. 17).

Venezuela**Zulia**

21. Missión Tucuco. *Melanomys* sp., 09°50'N, 72°52'W.

Contents and Geographic Distribution: The genus *Melanomys* occurs in the forested lowlands and mountains from Nicaragua to Peru and comprises three species: *Melanomys caliginosus* (Tomes, 1860), *Melanomys robustulus* (Thomas, 1914) and *Melanomys zunigae* (Sanborn, 1949). Recent published evidence suggests that the genus is more diverse than currently established (Hanson & Bradley, 2008).

M. caliginosus occurs in overgrown fields, brushy second growth, and edges of evergreen and semideciduous forest (Emmons & Feer, 1997). Elevation records extend from sea level to 2,133 m. *M. robustulus* is known only from southeastern Ecuador at high altitudes in northwestern Andean montane forest. *M. zunigae* is found in western-central Peru in deserts and xeric shrublands, in the Sechura Desert (Fig. 18).

Microakodontomys* Hershkovitz, 1993*Gazetteer****Brazil****Distrito Federal**

1. Parque Nacional de Brasília, about 20 km NW of Brasília. 15°47'S, 47°55'W.

Contents and Geographic Distribution: This monotypic genus (*Microakodontomys transitorius*) inhabits the fringe zone between open grassland and bordering scrubland of the Brazilian Cerrado (Hershkovitz, 1993). Known from the type locality only, but A.P. Carmignotto and R. Paresque (*pers. com.*) collected specimens of this genus in another locality of Central Brazilian Cerrado (Fig. 19).

101. Cerro Negro, 10 km NW Caripe [1,630-1,690 m]. *Microryzomys minutus*, 10°12'N, 63°32'W.

Táchira

102. Buena Vista, 41 km SW San Cristobal [2,350-2,420 m]. *Microryzomys minutus*, 07°27'N, 72°26'W.

Trujillo

103. Haciendas Misisi, 15 km E Trujillo [2,360 m]. *Microryzomys minutus*, 09°21'N, 70°18'W.

Contents and Geographic Distribution: The genus includes two valid species: *Microryzomys altissimus* (Osgood, 1933) and *Microryzomys minutus* (Tomes, 1860). The genus *Microryzomys* is autochthonous to the northern and central Andes, from northern Venezuela, through Colombia, Ecuador and Peru, to central Bolivia (Fig. 20 and 21). *Microryzomys altissimus* is more regularly associated with paramo environments. However, it can be found in arid scrubs, and humid temperate forest (Carleton & Musser, 1989). Altitudinally, *M. altissimus* is distributed from 2,000 to 4,300 m. *Microryzomys minutus* inhabits a variety of wet and cool Andean forests, like lower subtropical forest, lower montane moist forest, humid temperate forest, mossy subtropical forest, scrubby cloud forest on ridge, heavy cloud forest, and paramo, through a known altitudinal range that varies from 800 to 4,000 m.

Mindomys Weksler, Percequillo & Voss, 2006

Gazetteer

Ecuador

Pichincha

1. Mindo [1,281 to 1,285 m]. Type locality of *Nectomys hammondi*, 00°03'S, 78°46'W.
2. Near Mindo [1,220 m], 00°01'N, 79°00'W.

3. Oriente, Concepción; probably Hacienda Concepción, 00°06'S, 78°30'W.

Contents and Geographic Distribution: The genus *Mindomys* is monotypic, with the species *Mindomys hammondi* (Thomas, 1913) primarily known in the vicinity of Mindo in the western Andean foothills of Pichincha province, Ecuador (see comments on the geographic distribution of the genus on Weksler *et al.*, 2006). It occurs in subtropical montane and cloud forest. Elevation records extend from 1,220 to 1,285 m (Fig. 22).

Loreto

33. Rio Gálvez. *Neacomys minutus* and *Neacomys musseri*, 05°12'S, 72°53'W.

Suriname**Marowijne**

34. Marowijne, Perica. *Neacomys paracou*, 05°51'S, 54°43'W.

Contents and Geographic Distribution: Eight species are currently assigned to the genus *Neacomys*: *Neacomys dubosti* (Voss *et al.*, 2001), *Neacomys guianae* (Thomas, 1905), *Neacomys paracou* (Voss *et al.*, 2001), *Neacomys minutus* (Patton *et al.*, 2000), *Neacomys musseri* (Patton *et al.*, 2000), *Neacomys pictus* (Goldman, 1912), *Neacomys spinosus* (Thomas, 1882), and *N. tenuipes* (Thomas, 1900) (Fig. 23).

The genus *Neacomys* has never been broadly revised: the most recent revisionary efforts were elaborated by Patton *et al.* (2000) and Voss *et al.* (2001), who studied forms from the western Amazon and Guianan region, respectively; samples from Central Amazonia remain unstudied. Therefore, most distribution records provided here were obtained from the previously mentioned papers. All available evidence suggests that this genus is restricted to the Amazon Basin, with three species associated with the Guianan shield: *Neacomys dubosti*, which inhabits French Guiana and Brazil (Amapa); *Neacomys guianae*, from the coastal portion of Guyana; and *Neacomys paracou*, from French Guiana, Surinam, Guyana and Brazil (Amapa); and five species from the western Amazon: *Neacomys musseri*, known from Peru and from the headwaters of the Rio Juruá in western Brazil; *Neacomys spinosus*, from Ecuador, Peru and Brazil; *Neacomys pictus*, recorded only from eastern Panamá; *N. tenuipes*, found in central Colombia; and *Neacomys minutus*, known only from the central and lower portion of the Rio Juruá, Amazonas, Brazil.

Monagas

272. Cachipo. *Nectomys palmipes*, 09°56'N, 63°05'W.
 273. Caripito. *Nectomys palmipes*, 10°08'N, 63°06'W.
 274. San Antonio, 15 km do Cerro Turumiquere, Sucre, Venezuela. *Nectomys palmipes*, 10°22'S, 63°20'W.

275. San Antonio, 15 km E MT Turummiquere. *Nectomys palmipes*, 10°07'N, 63°43'W.

Sucre

276. 3 km NE Yaguaraparo. *Nectomys palmipes*, 10°34'N, 62°49'W.
 277. Dos Rios. *Nectomys palmipes*, 10°15'S, 63°53'W.
 278. Latal. *Nectomys palmipes*, 10°10'N, 63°55'W.
 279. San Juan de Uhare. *Nectomys palmipes*, 10°43'N, 62°46'W.

Contents and Geographic Distribution: *Nectomys* currently consists of five species: *N. apicallis* (Peters, 1861), present in the lowlands and Andean foothills of Ecuador and Peru; *N. magdalena* (Thomas, 1897), occurring on the basins of the Magdalena and Cauca Rivers, north Colombia; *N. palmipes* (Allen & Chapman, 1893), inhabiting the island of Trinidad and nearby region of northeastern Venezuela; *N. rattus* (Pelzeln, 1883), occurring in Colombia, Venezuela, Guianas, Suriname, north and central Brazil, and lowlands of Peru; and *N. squamipes* (Brants, 1827), inhabiting Brazil, northeastern Argentina and Paraguay (Fig. 24, 25 and 26).

Nephelomys Weksler, Percequillo & Voss, 2006

Gazetteer

Bolivia

Cochabamba

1. 25 km by road W Comarapa, Siberia [2,800 m]. *Nephelomys levipes*, 17°50'S, 64°45'W.
2. 28 km by road W of Comarapa [2,800 m]. *Nephelomys levipes*, 17°51'S, 64°47'W.
3. Chaparé [2,000 m]. *Nephelomys keaysi*, 16°30'S, 65°30'W.
4. Cuesta Cucho [ca. 2,300 m]. *Nephelomys levipes*, 17°15'S, 65°45'W.
5. El Choro [3,200 m]. *Nephelomys levipes*, 16°56'S, 66°42'W.
6. Incachaca [2,225-2,350 m]. *Nephelomys levipes*, 17°14'S, 65°49'W.
7. Locotal, [1,775 m]. *Nephelomys keaysi*, 17°11'S, 65°48'W.
8. Yuncas [1,200 m]. Possible misspelling of Yungas (see below). *Nephelomys levipes*, 16°S, 67°W.
9. Yungas [1,100 m]. Including Yungas of Cochabamba [2,000 m]. *Nephelomys levipes* and *Nephelomys keaysi*, 16°20'S, 66°45'W.
10. Yungas del Palmar [2,000 m]. (Palmar is the correct name for this location; see Paynter, 1992). *Nephelomys levipes*, 17°06'S, 65°29'W.

La Paz

11. 15 km (by road) NE Unduavi [2,400 m]. *Nephelomys levipes*, 16°14'S, 67°48'W.
12. 30 km (by road) N Zongo, Cement Mine [2,000 m]. *Nephelomys levipes*, 15°53'S, 67°52'W.
13. Cocopunco [3,050 m]. *Nephelomys levipes*, 15°30'S, 68°35'W.
14. El Astillero [2,700 m]. *Nephelomys levipes*, 16°15'S, 76°35'W [sic], a likely typographical error; the correct longitude is 67°35'W (Paynter, 1992).
15. La Joya [1,800 m]. *Nephelomys levipes*, 15°38'S, 68°19'W.
16. Ñequejahuirra [2,450 m]. *Nephelomys levipes*, 16°20'S, 67°50'W.
17. Ocara [ca. 2,500 m]. *Nephelomys levipes*, 15°39'S, 68°24'W.
18. Pitiguaya [ca. 1,700 m]. Not located. Paynter (1992) pointed that Pitiguaya is in La Florida. *Nephelomys keaysi*, 16°21'S, 67°46'W.
19. Rio Aceromarca, 1 km S Yerbani [2,600 m]. *Nephelomys levipes*, 16°19'S, 67°54'W.
20. Rio Unduavi [2,500 m]. *Nephelomys levipes*, 16°18'S, 68°01'W.
21. Ticunhuaya [1,500 m]. *Nephelomys keaysi*, 15°28'S, 68°18'W.

Santa Cruz

22. Serrania Siberia, 11 km NW by road of Torrecillas [2,650 m]. *Nephelomys levipes*, 17°53'S, 64°50'W.

Colombia

Antioquia

23. La Bodega; N lateral Rio Negrito – Rodovia Sonsón-Nariño [1,750 m]. *Nephelomys pectoralis*, 05°42'N, 75°07'W.
24. La Ceja [2,200 m]. *Nephelomys childi*, 06°02'N, 75°26'W.
25. La Frijolera [1,500 m]. *Nephelomys pectoralis*, 07°10'N, 75°25'W.
26. Piedras Blancas, 15 km E of Medellín [1,500 m]. *Nephelomys childi*, 06°15'N, 74°58'W.
27. San Pedro [2,650 m]. *Nephelomys childi*, 06°28'N, 75°33'W.
28. Santa Elena [2,750 m]. *Nephelomys childi*, 06°13'N, 75°30'W.
29. SE Medellin, Las Palmas [2,600 m], 06°10'N, 75°33'W. According to Paynter (1997), the correct name for this locality is Envigado, located 10 km S of Medellin [1,607 m]. *Nephelomys childi*, 06°10'N, 75°35'W.

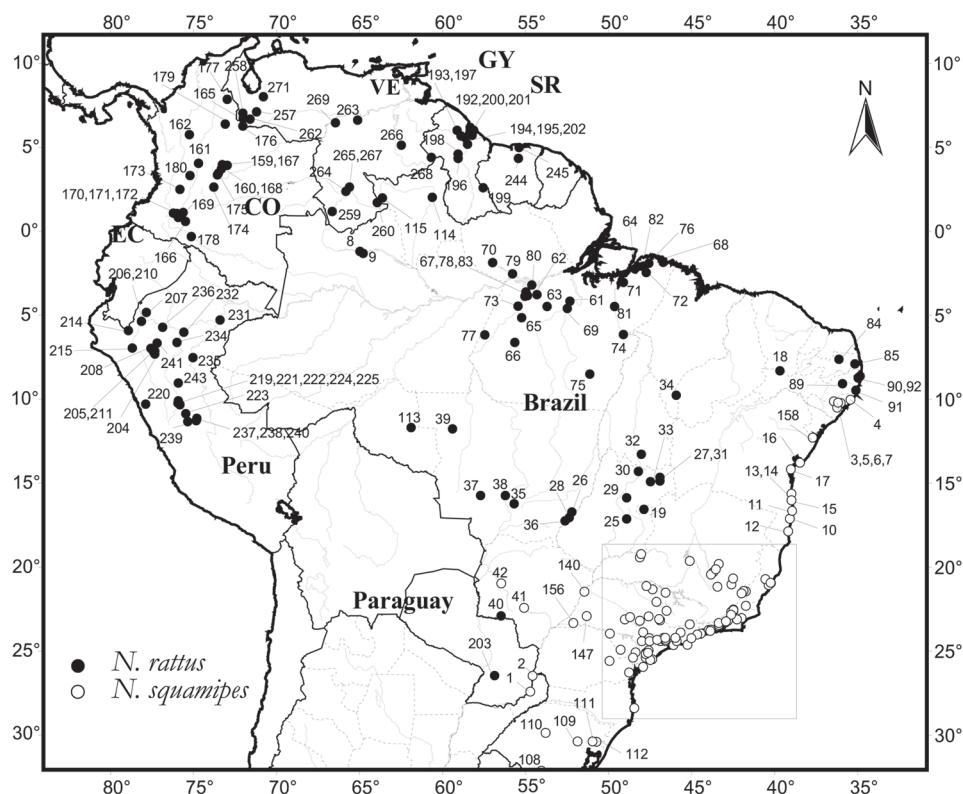

FIGURE 24: Map of collecting localities of *Nectomys* in Brazil, Paraguay, Peru, Ecuador, Colombia, Venezuela, Guyana, Suriname and Trinidad and Tobago. The number associated with each locality is the same used in the Gazetteer.

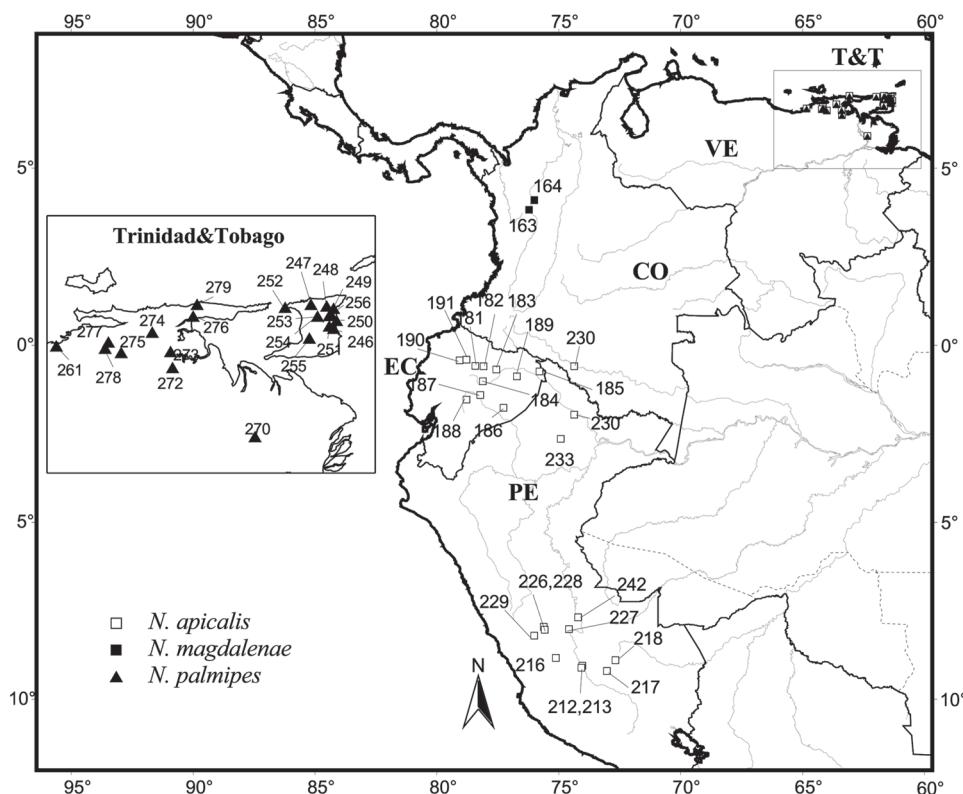

FIGURE 25: Detail of map showing localities for *Nectomys*.

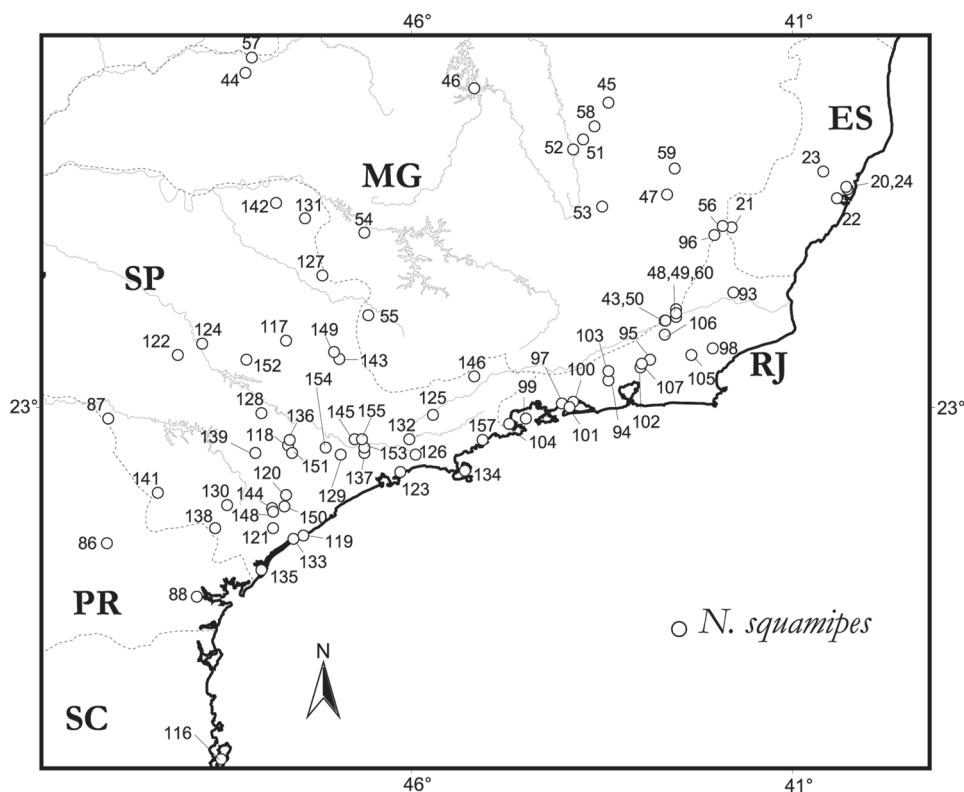

FIGURE 26: Detail of map showing localities for *Nectomys*.

30. Província de Sonsón, 15 km E Rio Negrito, 1,650 to 2,100 m. *Nephelomys childi*, 05°41'N, 74°57'W.
31. Província de Sonsón, 7 km E Páramo [2,900 to 3,050 m]. *Nephelomys childi*, 05°42'N, 75°11'W.
32. Província de Sonsón, 10 km E Las Frias [2,350 m]. *Nephelomys pectoralis* and *Nephelomys childi*, 05°57'N, 75°30'W.
33. Urrao, Guapantal [2,200 to 2,400 m]. *Nephelomys childi*, 06°20'N, 76°25'W.
34. Urrao, Santa Bárbara [2,700 to 3,100 m]. *Nephelomys childi*, 06°25'N, 76°15'W.
35. Valdivia [1,400 m]. *Nephelomys pectoralis*, 07°11'N, 75°27'W.
36. Valdivia, 10 km S [1,200, 1,500, 1,600 and 1,700 m]. *Nephelomys pectoralis*, 07°06'N, 75°27'W.
37. Valdivia, 9 km S [1,200, 1,400, 1,650 and 1,700 m]. *Nephelomys pectoralis*, 07°07'N, 75°27'W.
38. Valdivia, Ventanas [2,000 m]. *Nephelomys pectoralis*, 07°05'N, 75°27'W.

Boyacá

39. East Andes, La Primavera [2,150 m]. *Nephelomys meridensis*, 07°00'N, 72°20'W.

Caldas

40. Manizales, Rio Terciales [2,700 m]. *Nephelomys childi*, 04°58'N, 75°23'W.

Cauca

41. Almaguer, Andes Central [ca. 3,060 m]. *Nephelomys childi*, 01°55'N, 76°50'W.
42. Chacquayaco [actually, Charginayaco], [2,400 m]. *Nephelomys pectoralis*, 02°40'N, 76°57'W.
43. Cocal [1,225 to 1,835 m]. *Nephelomys pectoralis*, 02°31'N, 77°00'W.
44. Crest Range W of Popayán [also called Costa W of Popayán], [3,150 m]. Type locality of *Oryzomys pectoralis*. *Nephelomys pectoralis*, 02°34'N, 76°57'W.
45. [La] Gallera [1,750 m]. *Nephelomys pectoralis*, 02°35'N, 76°55'W.
46. Munchique [also include Munchique, side E], [2,520 to 2,550 m]. *Nephelomys pectoralis*, 02°32'N, 76°57'W.
47. Rio Mechengue [800 m]. *Nephelomys pectoralis*, 02°40'N, 77°12'W.

Cesar

48. [Província de] Valledupar, Villanueva, Sierra Negra. *Nephelomys maculiventer*. The coordinates of Sierra Negra is 10°36'N, 72°55'W.

Cundinamarca

49. [La] Aguadita [ca. 2,000 m]. *Nephelomys childi*, 04°25'N, 74°20'W.

50. [Província de] Guasca, Rio Balcones [2,720 m]. *Nephelomys childi*, 04°40'N, 73°33'W.
51. Anolaima [ca. 1,500 m]. *Nephelomys pectoralis* and *Nephelomys childi*, 04°46'N, 74°28'W.
52. Choachi [1,966 m]. *Nephelomys childi*, 04°32'N, 73°56'W.
53. Cuchillas del Carnisero, near Bogotá. Not located, see Planícies de Bogotá below. *Nephelomys pectoralis*.
54. El Berjon, near Bogotá. Not located, see Planícies de Bogotá below. *Nephelomys childi*.
55. Fusagasugá [1,830 m]. *Nephelomys childi*, 04°21'N, 74°22'W.
56. Paime [1,038 m]. *Nephelomys childi*, 05°22'N, 74°10'W.
57. Planícies de Bogotá [include near Bogotá], [2,590 m]. Type locality of *Oryzomys childi*. *Nephelomys childi*, 04°36'N, 74°05'W.
58. Rio San Francisco (Bogotá). Not located, see Planícies de Bogotá above. *Nephelomys childi*.
59. San Cristóbal, Bogotá [2,800 m]. San Cristóbal is a neighborhood of Bogotá. Not located.
60. San Francisco, Bogotá [3,400 m]. *Nephelomys childi*, 04°32'N, 73°18'W.
61. San Juan de Rio Seco [Rioseco], [1,303 m]. *Nephelomys childi*, 04°51'N, 74°38'W.

Huila

62. Acevedo, Rio Aguas Claras, San Adolfo [ca. 1,400-1,500 m]. *Nephelomys childi*, 01°49'N, 75°52'W.
63. Andalucia, E Andes [ca. 2,100 m]. *Nephelomys childi*, 01°54'N, 75°40'W.
64. El Parque Las Cuevas, [Includes 20 m pra dentro da entrada da caverna indiana; 25 m pra dentro da entrada da caverna indiana; 50 m pra dentro de La Cueva de Guacharos]. This is the Parque Nacional Natural Cueva de Los Guacharos, ca. 50 km SE de San Agustín [ca. 2,000 m]. *Nephelomys childi*, 01°41'N, 76°02'W.
65. San Agustín, Rio Ovejera [2,350 m]. *Nephelomys childi*, 01°57'N, 76°29'W.
66. San Agustín, Rio Magdalena [left or right bank], [2,300 to 2,350 m]. *Nephelomys childi*, 01°53'N, 76°13'W.
67. San Agustín, San Antonio [2,200, 2,250, 2,300 to 2,400 m]. *Nephelomys childi*, 01°57'N, 76°29'W.

La Guajira

68. Fonseca. Andes, Las Marimondas [ca. 1,000 m]. 10°35'N, 72°45'W. A place located about 20 km SE of Fonseca (see Paynter, 1997) is

located in the following geographical coordinates. *Nephelomys maculiventer*, 10°45'N, 72°55'W.

69. Macotama [2,500 m]. *Nephelomys maculiventer*, 10°55'N, 73°30'W.

70. San Miguel [1,700 m]. *Nephelomys maculiventer*, 10°58'N, 73°29'W.

Magdalena

71. Cerros San Lorenzo, San Lorenzo [ca. 2,600 m]. *Nephelomys maculiventer*, 11°10'N, 74°07'W.
72. El Líbano e Sierra El Líbano [1,850 m]. Type locality of *Oryzomys maculiventer*. *Nephelomys maculiventer*, 11°10'N, 74°00'W.
73. Las Taguas, Santa Marta. *Nephelomys maculiventer*, 11°06'N, 73°57'W.
74. Manzanares [915 m]. *Nephelomys maculiventer*, 11°14'N, 74°13'W.
75. Valparaíso [actually Cincinnati], [1,480 m]. *Nephelomys maculiventer*, 11°06'N, 74°06'W.

Meta

76. Buenavista, above Villavicencio, E Andes [80 km] SE Bogotá [1,372.5 m]. *Nephelomys childi*, 04°10'N, 73°41'W.
77. La Macarena (Serranía de), Pico Renjifo [ca. 1,390 m]. *Nephelomys childi*, ca. 03°06'N, 73°55'W.
78. Macarena Mt. [1,140 m]. *Nephelomys childi*, 02°45'N, 73°55'W.

Norte de Santander

79. Páramo de Tamá [2,440 m]. *Nephelomys meridensis*, 07°25'N, 72°26'W.

Quindío

80. El Roble [ca. 2,205 m] (Paynter, 1997). *Nephelomys pectoralis*, 04°41'N, 75°36'W.
81. W Quindío Andes, above Salento [ca. 2,775 m]. *Nephelomys childi*, 04°38'N, 75°34'W.
82. W Quindío Andes, La Guneta [ca. 3,150 m]. *Nephelomys childi*, 04°35'N, 75°30'W.

Tolima

83. E Quindío Andes, El Edén [ca. 2,560 m] (Paynter, 1997). *Nephelomys childi*, 04°30'N, 75°20'W.

Valle del Cauca

84. Las Lomitas [ca. 1,500 m]. *Nephelomys pectoralis*, 03°38'N, 76°38'W.
85. Los Tambos [2,440 m]. Not located, “possibly in the municipality of Pradera” (Paynter, 1997). *Nephelomys childi*, 03°25'N, 76°10'W.

86. Mira Flores, near Palmira [1,891 m]. *Nephelomys pectoralis*, 03°35'N, 76°10'W.
87. Peñas Blancas, Rio Pichindé [1,800 m]. *Nephelomys pectoralis*, 03°27'N, 76°43'W.
88. Rio Dagua, or Naranjito, Rio Dagua, W. Colombia [1,200 m]. *Nephelomys pectoralis*, 03°47'N, 76°44'W.
89. San Antonio [1,750 m]. *Nephelomys childi*, 03°30'N, 76°38'W.

Costa Rica

Alajuela

90. Lajas, Villa Quesada, 13 km by road San Carlos. *Nephelomys devius*, 10°15'N, 84°26'W.
91. Palmira de Zarcero. *Nephelomys devius*, 10°12'N, 84°23'W.
92. Rio Poasito, highway Volcán Poás. *Nephelomys devius*, 10°12'N, 84°23'W.
93. Volcán Poás. *Nephelomys devius*, 10°11'N, 84°13'W.

Cartago

94. Cordillera de Talamanca, part of the Rio Macho, Villa Mills. *Nephelomys devius*, 09°33'N, 83°42'W.
95. Cordillera de Talamanca that extends towards NW/SE. *Nephelomys devius*, 09°30'N, 83°40'W.
96. El Muñeco (Rio Navarro), 10 km SO Cartago. *Nephelomys devius*, 09°47'N, 83°59'W.
97. Estrella de Cartago. *Nephelomys devius*, 09°47'N, 83°58'W.
98. Mt. Irazú. *Nephelomys devius*, 09°58'N, 83°51'W.
99. Parque Nacional Volcán Irazú, Volcán Irazú. *Nephelomys devius*, 09°58'N, 83°51'W.

Heredia

100. 2.4 km S Cariblanco. *Nephelomys devius*, 10°14'N, 84°11'W.
101. 10 km NNE Heredia, Cerro Champipe. *Nephelomys devius*, 10°05'N, 84°05'W.
102. Parque Nacional Braulio Carrillo. *Nephelomys devius*, 10°17'N, 84°05'W.
103. Parque Nacional Braulio Carrillo, 5 km E Vara Blanca. *Nephelomys devius*, 10°10'N, 84°06'W.

Puntarenas

104. Monteverde, Cerro Amigos. *Nephelomys devius*, 10°19'N, 84°48'W.
105. Monteverde, Investigador. *Nephelomys devius*, 10°18'N, 84°48'W.
106. Monteverde, Quebrada Cuecha. *Nephelomys devius*, 10°18'N, 84°48'W.
107. Protero Grande, Tres Colinas. *Nephelomys devius*, 09°04'N, 83°05'W.

108. Reserva Bosque Nuboso Monteverde, 0.5 km below Ventana. *Nephelomys devius*, 10°18'N, 84°48'W.

San José

109. 0.5 km N El Empalme. *Nephelomys devius*, 09°45'N, 83°57'W.
110. 2.2 km E La Trinidad de Dota. *Nephelomys devius*, 09°49'N, 84°01'W.
111. 4 km S, 2 km E, Ojo de Agua. *Nephelomys devius*, 09°34'N, 83°48'W.
112. N San Isidro del General. *Nephelomys devius*, 09°50'N, 83°59'W.
113. Cerro de La Muerte. *Nephelomys devius*, 09°34'N, 83°31'W.
114. Cerro Estaquero. *Nephelomys devius*, 09°36'N, 83°46'W.
115. Fila La Maquina, ca. 3 km E Canaán. *Nephelomys devius*, 09°28'N, 83°35'W.
116. La Piedra, ca. 4.5 km SW Cerro Chirripó. *Nephelomys devius*, 09°27'N, 83°28'W.

Ecuador

Azuay

117. Las Cajas, Yacutuviana [2,300 m]. *Nephelomys albicularis*, 02°49'S, 79°16'W.
118. Mazán, Cuenca [2,700 m]. *Nephelomys albicularis*, 02°52'S, 79°16'W.
119. Molleturo [ca. 2,280 m]. *Nephelomys albicularis*, 02°48'S, 79°26'W.

Bolívar

120. Carmen, near Sinchic [ca. 2,290 m]. Not located, we used the geographic coordinates of Sinchic, also spelled Sinchig and Sinche. *Nephelomys albicularis*, 01°32'S, 78°59'W.

Cañar

121. Chical (also spelled Shical), [ca. 3,075 m]. *Nephelomys albicularis*, 02°24'S, 78°58'W.
122. Hoyaucshi. Not located.

Chimborazo

123. 4 km NE Pallatanga [ca. 2,225 m]. *Nephelomys albicularis*, 01°57'S, 78°55'W.
124. Pallatanga [1,509 m]. Type locality of *Oryzomys albicularis*. *Nephelomys albicularis*, 01°59'S, 78°57'W.

El Oro

125. Above Salvias, Cordillera da Chilla, on the trail of Salvias to Zaragoza, Llano de Guavos [2,013 m]. Not located. See coordinates below. *Nephelomys albicularis*.

126. Cordillera de Chilla, Taraguacocha [2,950 m]. *Nephelomys albicularis*, 03°40'S, 79°40'W.
127. El Chiral [1,625 m]. *Nephelomys albicularis*, 03°38'S, 79°41'W.
128. Salvias, Rio Amarillo [ca. 1,050 m] [include Salvias, the way to Zaraguro, 365 m above Salvias] [1,450 m]. *Nephelomys albicularis*, 03°39'S, 79°36'W.
145. Nanegal [road], [1,525 m]. *Nephelomys moerex*, 00°07'N, 78°40'W.
146. Near Mindo [1,220 m]. Not located. See Mindo, above. *Nephelomys moerex*.
147. Occidente, El Guarumal [2,245-2,290 m]. *Nephelomys moerex*, 00°16'S, 78°43'W.
148. Occidente, Guarumos, pathway to Mindo [1,200 m]. *Nephelomys moerex*, 00°04'S, 78°38'W.
149. Old pathway to Santo Domingo, ca. 2.5 km N (by road) Guarumal [1,982.5 m]. See Guarumal above. *Nephelomys moerex*.
150. Rio Tulipe, Gualea [1,200 m]. *Nephelomys moerex*, 00°05'N, 78°47'W.
151. San Jose, Oeste de Pichincha [2,800 m]. *Nephelomys moerex*, 00°10'N, 78°25'W.
152. San Tadeo, via Mindo [1,600 m] [include San Fadeo]. *Nephelomys moerex*, 00°01'N, 78°48'W.
153. Valle Ilambo, Gualea [1,800 m]. Not located, here we used the geographic coordinates of Gualea (see above). *Nephelomys moerex*.
154. Zapadores, Rio Saloya [1,952 m]. *Nephelomys moerex*, 00°14'S, 78°44'W.

Loja

129. 8 km W de Loja [2,200 m]. *Nephelomys albicularis*, 04°00'S, 79°17'W.
130. Alamor [1,325 m]. *Nephelomys albicularis*, 04°02'S, 80°02'W.
131. Celica [2,100 m]. *Nephelomys albicularis*, 04°07'S, 79°59'W.
132. Guachanamá, 10 km ENE de Celica; SE Loja [ca. 2,760 m]. *Nephelomys albicularis*, 04°02'S, 79°53'W.
133. Quebrada de La Mina, elevation about 125 m above Loja [2,318 m]. Not located, we used the geographic coordinates of Loja. *Nephelomys albicularis*, 04°00'S, 79°13'W.

Napo

134. Baeza [1,525 m]. *Nephelomys nimbosus*, 00°27'S, 77°53'W.
135. Baeza, by road to Napo [1,830 m]. See location above. *Nephelomys nimbosus*.
136. Chaco, Río Oyacachi. The proper name for this locality is El Chaco [1,615 m] (Paynter, 1993). *Nephelomys nimbosus*, 00°23'S, 77°49'W.

Pastaza

137. Chonta-Urcu – E [1,500 m]. Not located.
138. Mera [1,140 m]. *Nephelomys auriventer*, 01°28'S, 78°08'W.

Pichincha

139. Alaspungo, Road to Gualea [2,745 m]. *Nephelomys moerex*, 00°00'S, 78°36'W.
140. El Placer, P. Mindo. Not located. See the geographic coordinates of Mindo, below. *Nephelomys moerex*.
141. Gualea [1,525 m]. *Nephelomys moerex*, 00°07'N, 78°50'W.
142. Guarumos, W Pichincha [2,000 m]. See Guarumos, way to Mindo bellow. *Nephelomys moerex*.
143. Las Maquinas, pathway to San Domingo [2,135 m]. Also called Las Machinas. *Nephelomys moerex*, 00°28'S, 78°44'W.
144. Mindo [1,281 to 1,285 m]. Type locality of *Oryzomys albicularis moerex*. *Nephelomys moerex*, 00°03'S, 78°46'W.

145. Nanegal [road], [1,525 m]. *Nephelomys moerex*, 00°07'N, 78°40'W.
146. Near Mindo [1,220 m]. Not located. See Mindo, above. *Nephelomys moerex*.
147. Occidente, El Guarumal [2,245-2,290 m]. *Nephelomys moerex*, 00°16'S, 78°43'W.
148. Occidente, Guarumos, pathway to Mindo [1,200 m]. *Nephelomys moerex*, 00°04'S, 78°38'W.
149. Old pathway to Santo Domingo, ca. 2.5 km N (by road) Guarumal [1,982.5 m]. See Guarumal above. *Nephelomys moerex*.
150. Rio Tulipe, Gualea [1,200 m]. *Nephelomys moerex*, 00°05'N, 78°47'W.
151. San Jose, Oeste de Pichincha [2,800 m]. *Nephelomys moerex*, 00°10'N, 78°25'W.
152. San Tadeo, via Mindo [1,600 m] [include San Fadeo]. *Nephelomys moerex*, 00°01'N, 78°48'W.
153. Valle Ilambo, Gualea [1,800 m]. Not located, here we used the geographic coordinates of Gualea (see above). *Nephelomys moerex*.
154. Zapadores, Rio Saloya [1,952 m]. *Nephelomys moerex*, 00°14'S, 78°44'W.

Tungurahua

155. Mirador, Baños [1,500 m]. Type locality of *Oryzomys auriventer*. *Nephelomys auriventer*, 01°26'S, 78°15'W.
156. Palmera [1,300 m]. *Nephelomys auriventer*, 01°25'S, 78°12'W.
157. San Antonio [2,051.7 m]. Type locality of *Oryzomys auriventer nimbosus*. *Nephelomys nimbosus*, 01°26'S, 78°22'W.
158. San Francisco, E de Amabato [= Ambato], [2,440 m]. Not located, here we used the geographic coordinates of Ambato. *Nephelomys nimbosus*, 01°15'S, 78°37'W.

Panamá

Bocas del Toro

159. 25 km NNE San Felix. *Nephelomys devius*, 08°30'N, 81°49'W.
160. Fish Camp. *Nephelomys devius*, 08°58'N, 82°40'W.
161. First Camp. *Nephelomys devius*, 08°56'N, 82°42'W.
162. Rio Changuena, Rancho Mojica. *Nephelomys devius*, 09°10'N, 82°35'W.

Chiriquí

163. 14.5 km NW Finca Santa Clara, El Volcán. *Nephelomys devius*, 08°51'N, 82°44'W.
164. 15.5 km NNW Osta Clara. *Nephelomys devius*, 08°52'N, 82°44'W.
165. 17 km NNW headwaters of the Rio Candela, El Volcán. *Nephelomys devius*, 08°54'N, 82°43'W.

166. Boquete, NE, near Rio Cylindro. *Nephelomys devius*, 08°50'N, 82°22'W.
167. Boquete. *Nephelomys devius*, 08°47'N, 82°25'W.

260. Rio Mucujún [2,745 m]. *Nephelomys meridensis*, 08°36'N, 71°09'W.
261. Sierra de Mérida [1,641 m]. *Nephelomys meridensis*, 08°36'N, 71°08'W.

Mérida

244. El Escorial [2,500 m]. *Nephelomys meridensis*, 08°38'N, 71°05'W.
245. La Carbonera, 12 km SE La Azulita [2,190 m]. *Nephelomys meridensis*, 08°38'N, 71°21'W.
246. La Coromoto, 4 km E, 6.5 km S Tabay [3,080 m] (= La Coromoto, 7 km SE Tabay, 3,070-3,410 m). Refugio intermediário 5.5 km E, 2 km S Tabay [2,550 m] (= Refugio intermediário, 6 km ESSE Tabay, 2,550-2,710 m). According to Handley all locations can be signed up as Tabay (Parque Nacional da la Sierra Nevada, 4 a 9 km E and SE and 1 km SW Tabay), [1,530 and 2,077-3,830 m]. *Nephelomys meridensis*, 08°36'N, 71°01'W.
247. La Montaña, 3.1 km SE de Merida [2,250 m]. *Nephelomys meridensis*, 08°35'N, 71°08'W.
248. La Montaña, 4.1 km SE de Merida [2,600 m]. *Nephelomys meridensis*, 08°34'N, 71°07'W.
249. La Mucuy [include near La Mucuy], 4.9 km E de Tabay [2,400 m]. *Nephelomys meridensis*, 08°37'N, 71°01'W.
250. Mérida [1,641 m]. Type locality of *Oryzomys meridensis*. *Nephelomys meridensis*, 08°36'N, 71°08'W.
251. Montañas del Valle [2,165 m]. *Nephelomys meridensis*, 08°40'N, 71°06'W.
252. Montes de Cacute [2,500 and 2,800 m]. *Nephelomys meridensis*, 08°40'N, 71°02'W.
253. Montes de Chama [also spelled Monte Chama], [2,500 m]. *Nephelomys meridensis*, 08°31'N, 71°22'W.
254. Montes de La Culata [2,800 and 4,000 m]. *Nephelomys meridensis*, 08°45'N, 71°05'W.
255. Montes de La Sierra [2,500 m]. Not located. Probably Monte Sierra or more precisely Sierra Mountains (see Paynter, 1982). *Nephelomys meridensis*, 08°36'N, 71°00'W.
256. Montes de La Sierra Nevada [3,000 m]. *Nephelomys meridensis*, 08°33'N, 71°03'W.
257. Montes de Los Nevados [2,500 m] (Los Nevados, Paynter, 1982). *Nephelomys meridensis*, 08°28'N, 71°04'W.

Miranda

262. 1 km N Caracas, Quebrada Chacaito (see Handley, 1976), [1,140 m]. Not located. We used the geographic coordinates of Caracas. *Nephelomys caracolus*, 10°30'N, 66°55'W.
263. Curupao, 19 km E Caracas [1,160 m]. *Nephelomys caracolus*, 10°30'N, 66°38'W.

Táchira

264. Buena Vista, 35 km S, 22 km W de San Cristóbal [2,355, 2,395, 2,396, 2,400, 2,405, 2,410, 2,415, 2,420 m], (the original label). According to Handley (1976) the correct location is Buena Vista (near Paramo de Tama), 41 km SE San Cristóbal, 12 km SSE Las Delicias. *Nephelomys meridensis* and *Nephelomys childi*, 07°27'N, 72°26'W.
265. Páramo de Tamá [2,500 m]. *Nephelomys meridensis*, 07°25'N, 72°26'W.
266. Táchira. *Nephelomys meridensis*, 07°50'N, 72°05'W.

Trujillo

267. Hacienda Misisí, 14 km E Trujillo [2,215, 2,220, 2,225, 2,230, 2,360, 2,365 m]. *Nephelomys meridensis*, 09°21'N, 70°18'W.

Contents and Geographic Distribution: The genus *Nephelomys* comprises 13 valid species: *N. albicularis* (Tomes, 1860), *N. auriventer* (Thomas, 1899), *N. caracolus* (Thomas, 1914), *N. childi* (Thomas, 1825), *N. devius* (Bangs, 1902), *N. keaysi* (Allen, 1900), *N. levipes* (Thomas, 1902), *N. maculiventer* (Allen, 1899), *N. meridensis* (Thomas, 1894), *N. moorex* (Thomas, 1914), *N. nimbus* (Anthony, 1926), *N. pectoralis* (Allen, 1912), and *N. pirrensis* (Goldman, 1913). The genus *Nephelomys* is found in humid montane ("cloud") forests from Bolivia throughout the Andes to the Central American cordilleras until Costa Rica, and eastward along the Caribbean coastal mountains in eastern Venezuela (Percequillo, 2003) (Fig. 27, 28, 29, 30 and 31).

Nephelomys albicularis inhabits the eastern and western slopes of the Andean Oriental Cordillera, from northwestern Peru to central Ecuador. This species is present on both sides of the Huancabamba Depression,

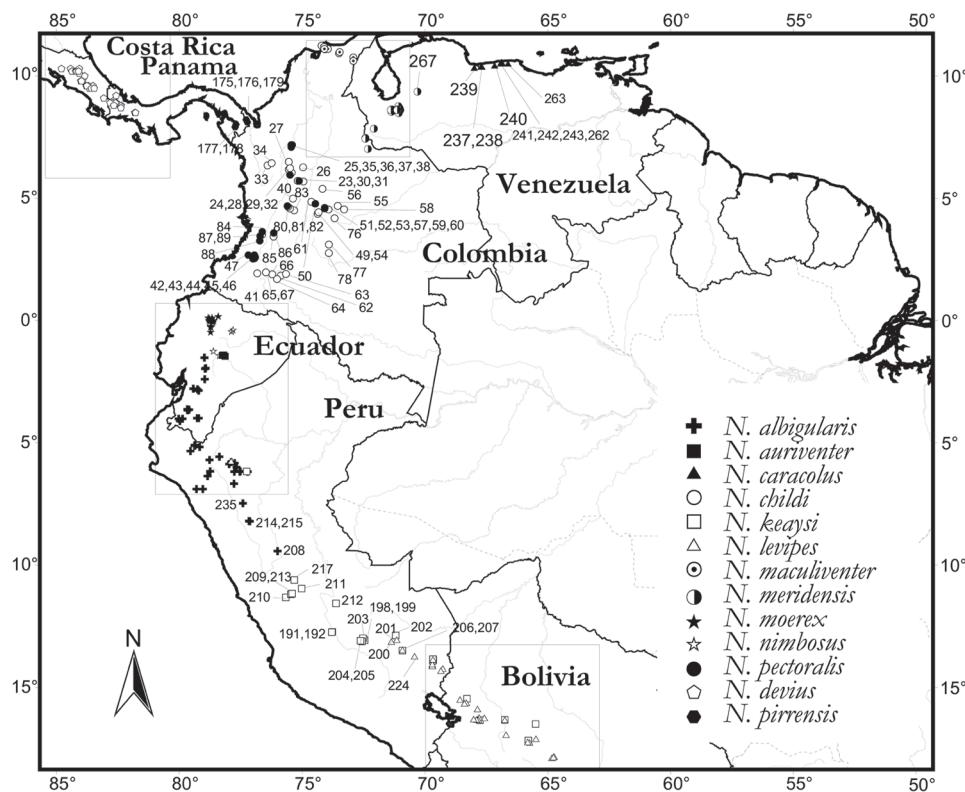

FIGURE 27: Map of collecting localities of *Nephelomys* in Bolívia, Peru, Ecuador, Colombia, Venezuela, Panama and Costa Rica. The number associated with each locality is the same used in the Gazetteer.

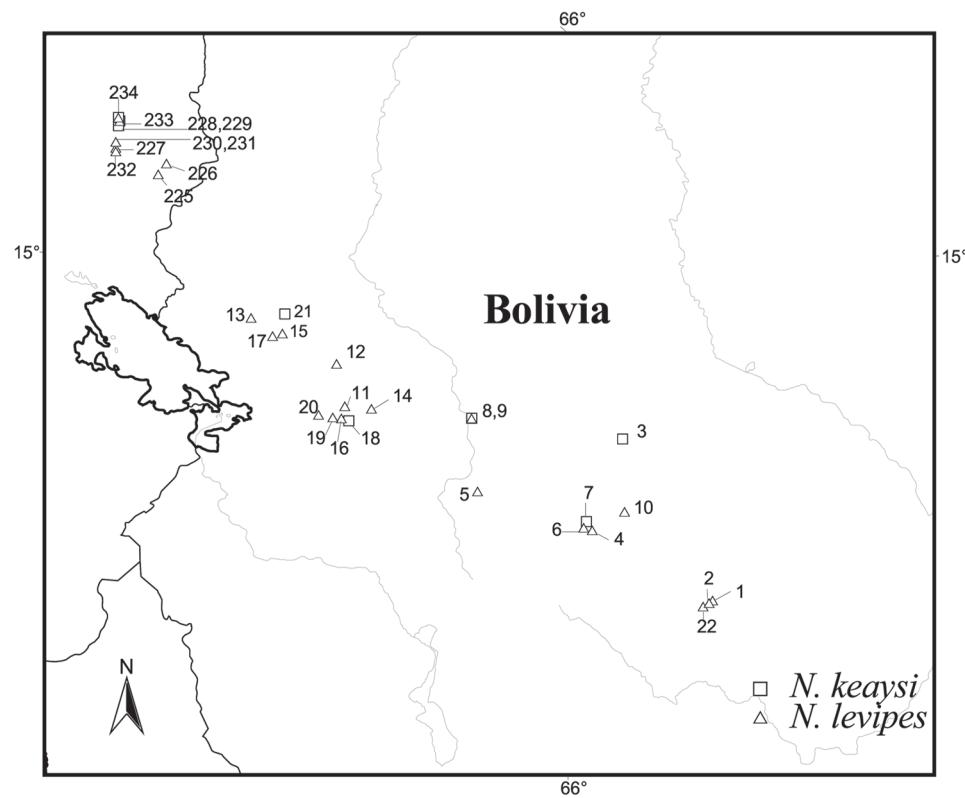

FIGURE 28: Detail of map showing localities for *Nephelomys*.

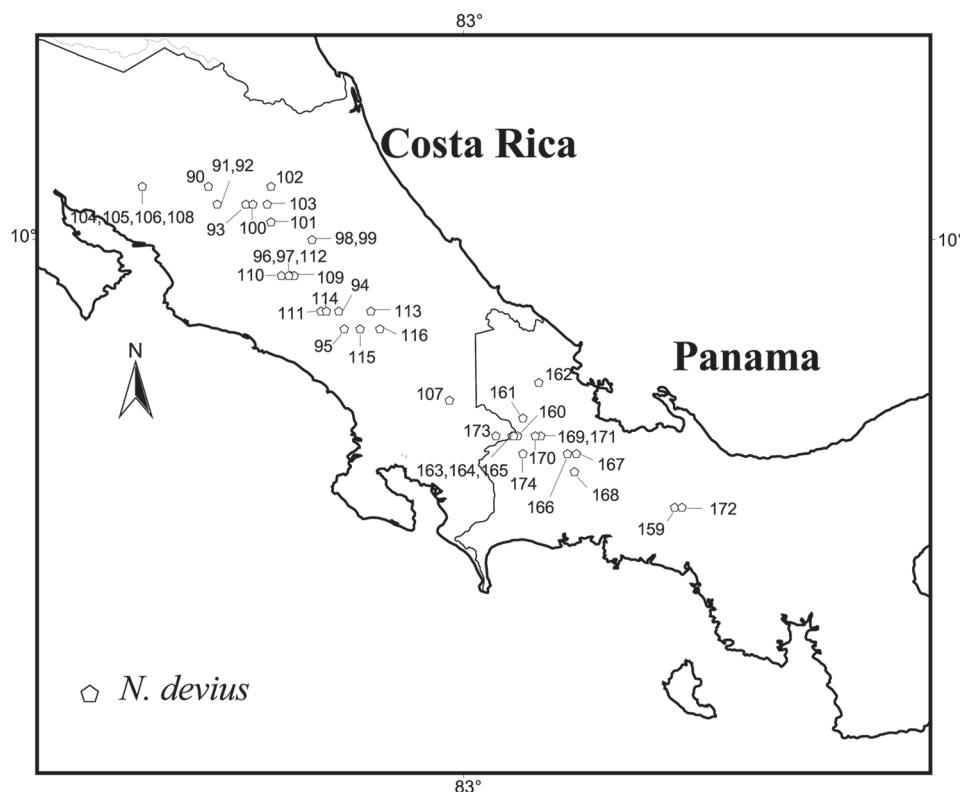

FIGURE 29: Detail of map showing localities for *Nephelomys*.

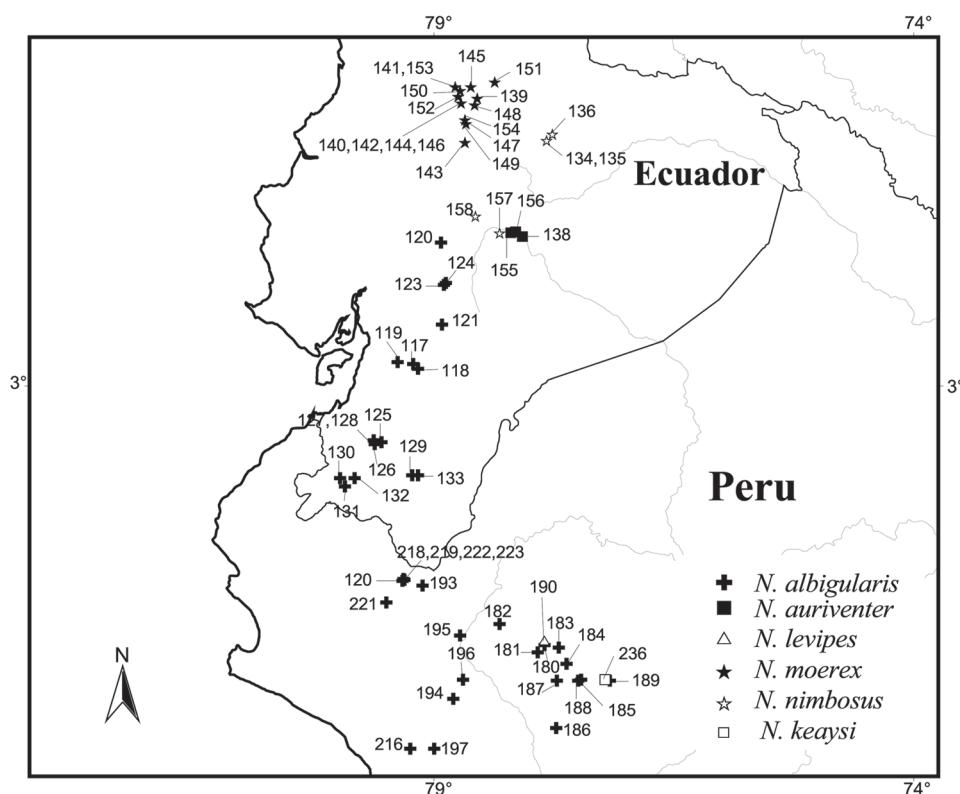

FIGURE 30: Detail of map showing localities for *Nephelomys*.

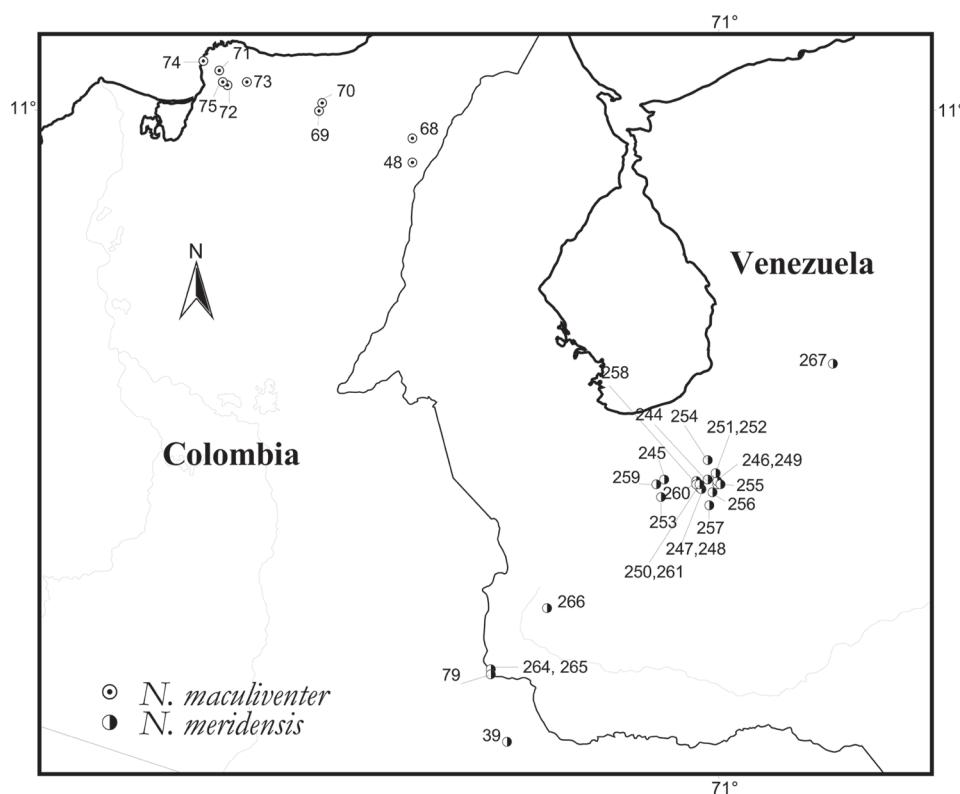

FIGURE 31: Detail of map showing localities for *Nephelemys*.

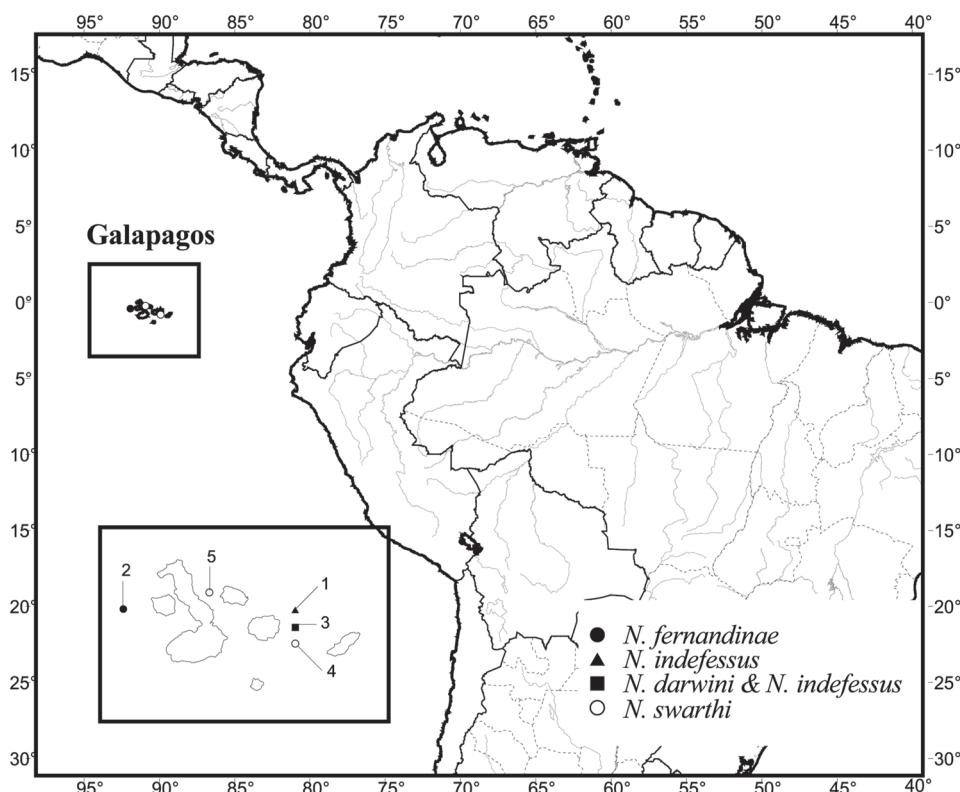

FIGURE 32: Map of collecting localities of *Nesoryzomys* in Ecuador. The number associated with each locality is the same used in the Gazetteer.

and also in isolated forested patches within this area. The elevational range is from 900 to 3,100 m.

Nephelomys auriventer is known from only three localities in the upper Río Pastaza drainage at the Cordillera Oriental of Ecuador and from one locality in the Apurimac drainage in the Cordillera Oriental of Peru, at elevations ranging from 1,140 (Mera) to 1,660 m (Huanhuachayo).

Nephelomys caracolus is distributed throughout the Venezuelan Cordillera de la Costa in Aragua, Carabobo, and Miranda states as well as the Distrito Federal. Most records are associated with the Caribbean (or northern) slope; only a few samples are from the southern slope. Elevation ranges from 1,050 to 2,300 m.

Nephelomys childi is endemic to Colombia, occurring in the Central, Oriental, and Occidental Cordilleras. In the Cordillera Oriental, this species is distributed in three disjunct areas: on eastern and western forested slopes from the headwaters of Río Magdalena (Huila department), in the Sierra de Macarena (Departamento de Meta), and in the region of the plains of Bogotá (Cundinamarca department). In the Central Cordillera, isolated populations occur in upper Cauca and Magdalena drainages (departments of Huila and Cauca, respectively) and on the eastern slope in the departments of Antioquia, Caldas, Quíndio, and Tolima. The only known populations of *N. childi* in the Cordillera Occidental are isolated on the extreme northwestern slope, at Santa Barbara and Guapantán (Antioquia department). This species occurs from 1,140 to 3,400 m in elevation.

Nephelomys devius is distributed throughout the Atlantic and Pacific slopes of Central Cordillera of Panama and Costa Rica, predominantly in cloud forest. Altitudinally, this species ranges from 1,000 to 3,432 m of altitude above sea level.

Nephelomys keyssi occurs along the forested eastern slopes of the Andes in Bolivia and Peru from Chaparé, Cochabamba, Bolivia to Santa Cruz, SSE Oxpampa, Pasco, Peru, at elevations between 1,000 and 2,600 m (although most records are from 1,200 to 1,500 m). The species is not known from above tree line on the Altiplano, or from the deforested slopes of the western Andes.

Nephelomys levipes inhabits cloud and elfin forests on the eastern slopes of the Andes in northwestern Bolivia and southwestern Peru, at an elevation ranging from 1,800 to 3,200 m.

All known collecting localities of *N. maculiventer* are from the slopes of Sierra Nevada de Santa Marta and Serranía de Perijá, in northern Colombia. This species occurs from 900 to 2,600 m above sea level within montane and cloud forest domains.

Nephelomys meridensis occurs on the forested slopes from northeastern Cordillera Oriental of Colombia in the Boyacá department, through the Páramo de Tamá on the Colombian-Venezuelan border, to the northern portion of the Sierra de Mérida, in Trujillo state, Venezuela, and over an elevation range from 1,100 to 4,000 m.

Nephelomys nimbosus is endemic to Ecuador, with all known collecting localities from the eastern Andean slope in Napo and Tungurahua provinces. Along the Pastaza drainage river, this species is parapatric with *N. auriventer*, replacing it in the higher elevations (2,000 to 2,440 m for *N. nimbosus*, 1,500 m for *N. auriventer*).

Nephelomys pectoralis is an endemic of Colombia, occurring in each of the three Andean cordilleras. This species is restricted to the western slope of the Cordillera Oriental, occurs along the length of the Cordillera Central, and is present on the forested western slope and upper regions of the eastern slope of the Cordillera Oriental.

Nephelomys pirrensis occurs only in few localities in the eastern portion of Panama, along the Serranía de Pirre, in moist broadleaf forest. The known altitudinal range varies from 1,150 to 1,790 m.

Contents and Geographic Distribution: As well as in *Holochilus*, distribution data was obtained from museum databases and from literature (Hershkovitz, 1960). Consequently, we could confidently employ data only on genus level. According to these data, *Oecomys* is

widely distributed in South America and eastern Central America, inhabiting predominantly mature and secondary lowland and montane rainforests, but also dry, semideciduous forests scattered through open areas, like the ones in the Cerrado (Fig. 33).

Contents and Geographic Distribution: In the genus *Oligoryzomys*, as in *Holochilus* and *Oecomys*, the distribution data was obtained from museum databases. In this way, we could confidently employ data only on genus level again. According to these data, *Oligoryzomys* comprises a diverse group distributed from northern Central America to the southernmost part of South America, inhabiting environments like rain forest (Amazonian and Atlantic Forests), open and dry areas (Cerrado, Caatinga and Restinga) and flooding-prone areas (Pampas and Pantanal) (Lima *et al.*, 2003; Weksler & Bonvicino, 2005; Paresque, 2010) (Fig. 34).

4. 4 km W Chaupe. Not located; we used the geographic coordinates of Chaupe, 05°10'S, 79°10'W.

Contents and Geographic Distribution: *Oreoryzomys* is a monotypic genus, containing *O. balneator* (Thomas, 1900). This species occurs in few localities on both western and eastern slopes of the Andes in Ecuador and Peru, in humid montane forests (Fig. 35). The known altitudinal range varies from 1,500 to 1,586 m.

Zulia

3. El Caimito, 40 km NE de Maracaibo. *Oryzomys gorgasi*, 10°57'N, 71°23'W.

Contents and Geographic Distribution: Two species of the genus *Oryzomys* are marginally distributed in South America (Fig. 36): *Oryzomys couesi* (Alston, 1877) and *Oryzomys gorgasi* (Hershkovitz, 1971).

Oryzomys couesi is known from only one locality in northern Colombia; this species is widely distributed in Central and North America, and this South American record may represent a marginal record of this species. *Oryzomys gorgasi* is known from two specimens, one from the eastern coast of the gulf of Maracaibo in northern Venezuela and the other from northern Colombia; it occurs in coastal environments, as mangroves and freshwater inundated grasslands (Hershkovitz, 1971; Sánchez *et al.*, 2001).

Contents and Geographic Distribution: The genus *Pseudoryzomys* is represented by the species *P. simplex* (Winge, 1887). Available collecting localities are from northeastern Argentina, western Paraguay to eastern Bolivia, and from there eastward through Brazil and far in the northeastern portion of this latter country (Fig. 37, 38 and 39). This rodent is confined to lowland areas with strong seasonal rainfall, like grasslands and wetlands (campo úmido), found throughout the Chaco, Cerrado and Caatinga.

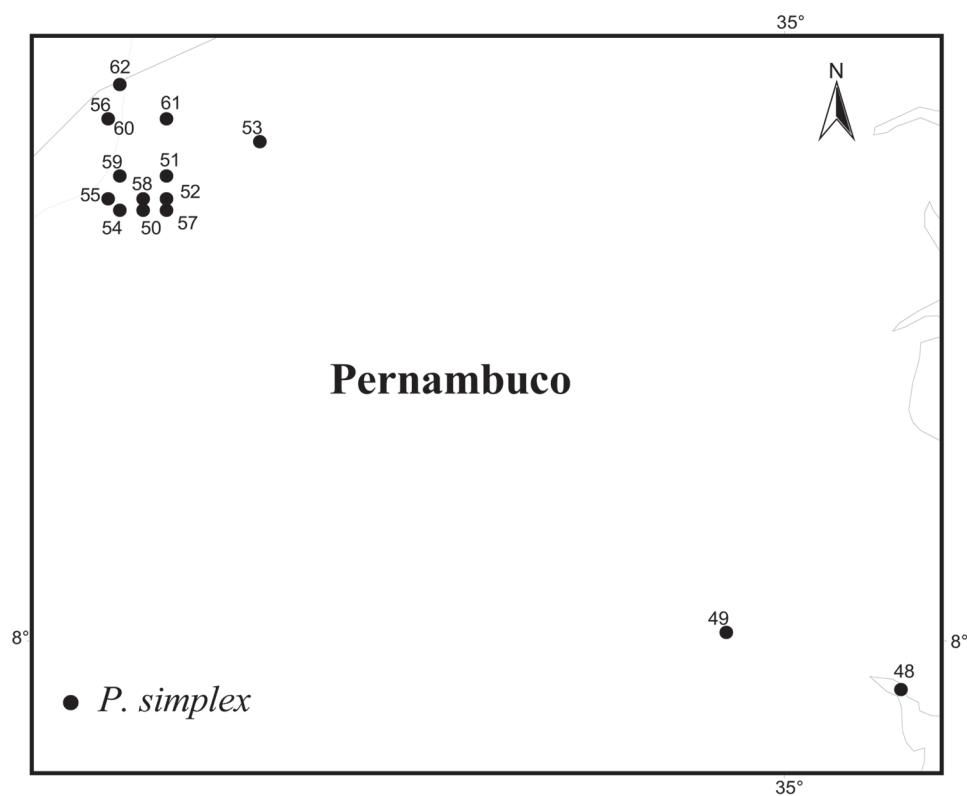

FIGURE 38: Detail of map showing localities for *Pseudoryzomys*.

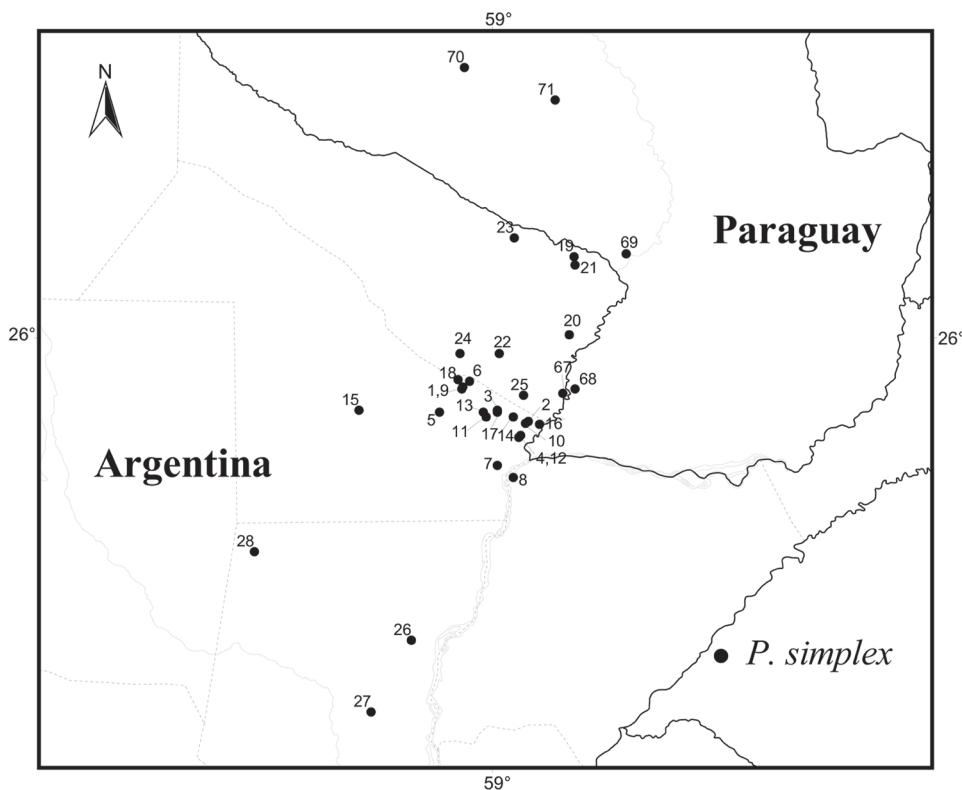

FIGURE 39: Detail of map showing localities for *Pseudoryzomys*.

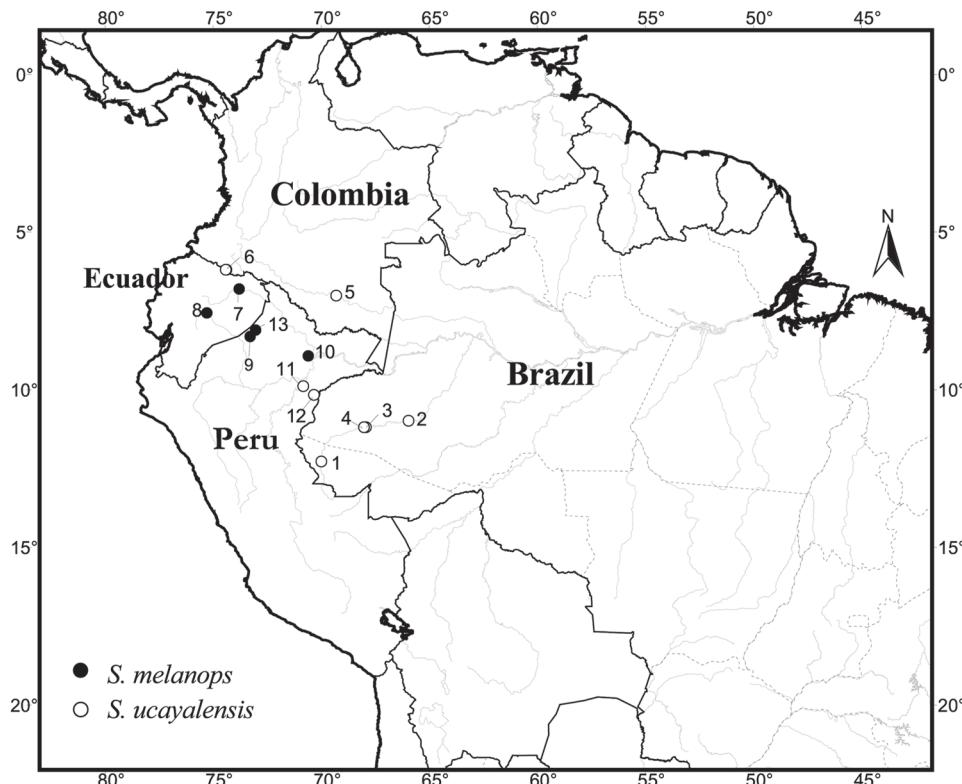

FIGURE 40: Map of collecting localities of *Scolomys* in Brazil, Peru, Ecuador and Colombia. The number associated with each locality is the same used in the Gazetteer.

11. San Jacinto. *Scolomys melanops*, 02°19'S, 75°52'W.
12. Centro de Investigaciones Jenaro Herrera. *Scolomys ucayalensis*, 04°52'S, 73°39'W.
13. Nuevo San Juan, Río Gálvez. *Scolomys ucayalensis*, 05°15'S, 73°10'W.

Contents and Geographic Distribution: The genus *Scolomys* comprises two species according to Gómez-Laverde et al. (2004): *S. melanops* (Thomas, 1924) and *S. ucayalensis* (Pacheco, 1991), including *S. juruense* (Patton & Silva, 1995). The genus occupies terrestrial habitats within both intact and disturbed forests and other secondary vegetation (Gómez-Laverde et al., 2004) (Fig. 40).

Scolomys melanops occurs on the eastern slopes of the Andes of Ecuador and Peru, in lowland and montane rainforest from 175 to 1,160 m.

Scolomys ucayalensis occurs in southern Colombia, northeastern Peru, and western Brazil, inhabiting lowland and montane Amazon rainforest. The known altitudinal range varies from 135 to 780 m.

Tacarcuna

16. Tacarcuna. *Sigmodontomys alfari*, 08°07'N, 77°17'W.
17. Vila Tacarcuna. *Sigmodontomys alfari*, 08°05'N, 77°17'W.

Contents and Geographic Distribution: The genus *Sigmodontomys* is composed of two species, *Sigmodontomys alfari* (J.A. Allen, 1897) and *Sigmodontomys aphrastus* (Harris, 1932), which inhabit the lower montane rain forest and premontane rain forest of Central American and northwestern Andes (Fig. 41).

Sigmodontomys aphrastus presents collecting localities in Costa Rica, Panama and Ecuador. According to Weksler (2006) and Weksler & Percequillo (2011), a new genus should be erected to contain *S. aphrastus*, but for the purposes of this contribution we will maintain both species under the genus *Sigmodontomys*.

Sigmodontomys alfari presents a more comprehensive distribution in Central America, with records from Honduras, Nicaragua, Costa Rica, Panama and from northern Colombia. Altitudinally, records of *S. aphrastus* vary from 1,219 to 2,600 m and *S. alfari* varies from 110 to 1,050 m, suggesting that one taxon replace the other across the altitudinal gradient where they cooccur.

Contents and Geographic Distribution: The genus *Transandinomys* is composed of two species,

Transandinomys bolivaris (Allen, 1901) and *Transandinomys talamancae* (Allen, 1891). Both species are typical trans-Andean dwellers (Fig. 43, 44 and 45).

The available evidence suggests that *T. bolivaris* occurs from northeastern Honduras through eastern Nicaragua, Costa Rica, Panamá, and western Colombia to western-central Ecuador in trans-Andean humid forest, along a known altitudinal range that varies from sea level to 2,550 m.

All known collecting localities of *T. talamancae* are distributed from north-western Costa Rica, east through Panamá into northwestern Venezuela, western Colombia, and the length of western Ecuador. It inhabits tropical forest, both evergreen and deciduous, from sea level to 1,386 m of altitude.

 188. Rio Cocoliar [792 m]. *Zygodontomys brevicauda*, 10°10'N, 63°47'W.
 189. San Antonio Maturin [792 m]. *Zygodontomys brevicauda*, 10°07'N, 63°43'W.

Nueva Esparta

190. Cerro Matasiete [405-420 m]. *Zygodontomys brevicauda*, 11°02'N, 63°53'W.

Portuguesa

191. vicinity of Acarigua [500 m]. *Zygodontomys brevicauda*, 09°33'N, 69°12'W.
 192. Colegio Agricola Turen [120 m]. *Zygodontomys brevicauda*, 09°20'N, 69°06'W.
 193. Tierra Buena [500 m]. *Zygodontomys brevicauda*, 09°18'N, 69°27'W.

Sucre

194. 11-24 km E Cumana [20 m]. *Zygodontomys brevicauda*, 10°28'N, 64°10'W.
 195. Cristobal Colón [457 m]. *Zygodontomys brevicauda*, 10°39'N, 61°56'W.
 196. Cuchivano [213 m]. *Zygodontomys brevicauda*, 10°15'N, 63°55'W.
 197. Cumanacoa [213 m]. *Zygodontomys brevicauda*, 10°15'N, 63°55'W.
 198. Ensenada Cauranta [4-7 m]. *Zygodontomys brevicauda*, 10°38'N, 62°15'W.
 199. Finca Vuelta Larga [10 m]. *Zygodontomys brevicauda*, 10°33'N, 63°07'W.
 200. Manacal [410-495 m]. *Zygodontomys brevicauda*, 10°37'N, 63°01'W.
 201. Quebrada Seca [213 m]. *Zygodontomys brevicauda*, 10°18'N, 63°57'W.

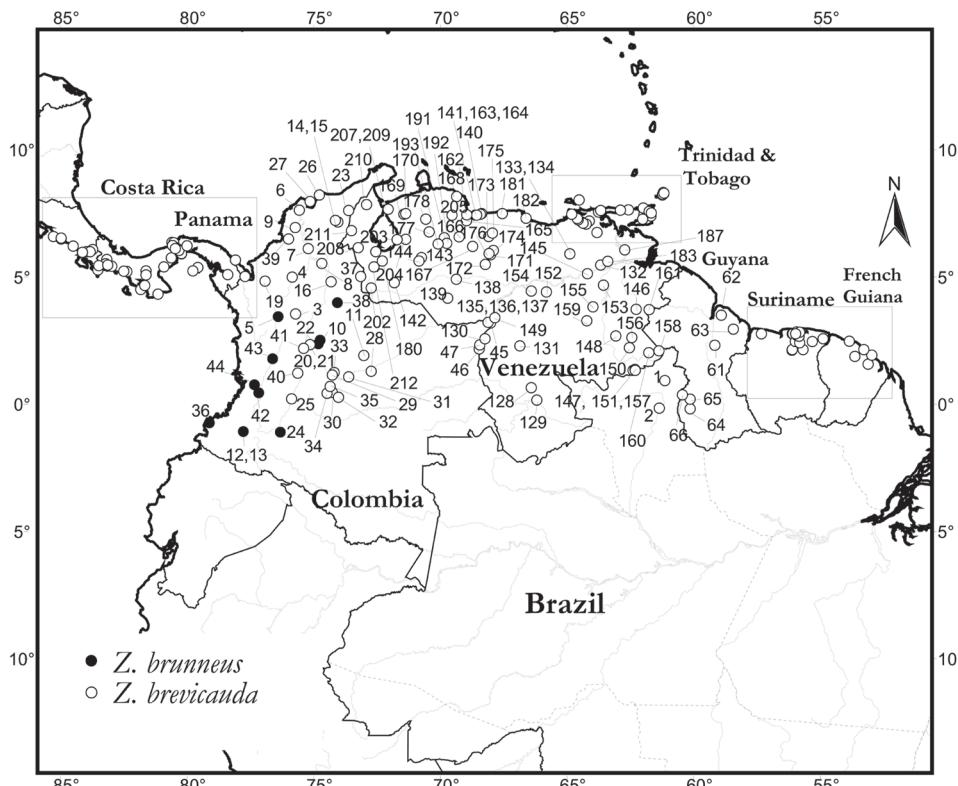

FIGURE 46: Map of collecting localities of *Zygodontomys* in Colombia, Venezuela, Panama, Costa Rica, Trinidad and Tobago, Guyana, Suriname and French Guiana. The number associated with each locality is the same used in the Gazetteer.

Táchira

202. Estación Experimental Santa Rosa-Santo Domingo [300 m]. *Zygodontomys brevicauda*, 07°34'N, 72°05'W.

Trujillo

203. 52 km WNW Valera, near Santa Apolonia [29-39 m]. *Zygodontomys brevicauda*, 09°28'N, 71°04'W.
 204. El Dividive [90 m]. *Zygodontomys brevicauda*, 09°29'N, 70°44'W.

Yaracuy

205. Finca El Jaguar [820 m]. *Zygodontomys brevicauda*, 10°26'N, 68°54'W.

Zulia

206. 5 km N San Carlos de Zulia [100 m]. *Zygodontomys brevicauda*, 00°01'N, 71°55'W.
 207. El Panorama [100 m]. *Zygodontomys brevicauda*, 10°40'N, 71°25'W.
 208. El Rosario [37 m]. *Zygodontomys brevicauda*, 09°09'N, 72°36'W.
 209. Empalado Savanna, sea level. *Zygodontomys brevicauda*, 10°40'N, 72°25'W.
 210. Hacienda Rodeo [80 m]. *Zygodontomys brevicauda*, 10°51'N, 72°16'W.

211. Mision Tukuk [200 m]. *Zygodontomys brevicauda*, 09°50'N, 72°52'W.
 212. Morotuto [100 m]. *Zygodontomys brevicauda*, 08°24'N, 71°59'W.

Contents and Geographic Distribution: According to the last revision (Voss, 1991), the genus *Zygodontomys* encompasses two species, the monotypic *Zygodontomys brunneus* (Thomas, 1898), and the polytypic *Zygodontomys brevicauda* (J.A. Allen & Chapman, 1893), that includes *Z. b. brevicauda*, *Z. b. cherriei* (Allen, 1895) and *Z. b. microtinus* (Thomas, 1894).

The genus occurs in unforested landscapes from the Pacific coast and foothills of eastern Costa Rica through Panama, Colombia, Venezuela, Guyana, Surinam, French Guiana, and Brazil north of the Amazon. *Zygodontomys* also occurs on adjacent continental-shelf islands (Trinidad and Tobago) where it may occupy forest as well as nonforest habitats (Fig. 46, 47, 48 and 49). *Z. brunneus* is known only from the intermontane valleys of Colombian Andes; elevation of collection localities range from 350 to 1,300 m. *Z. brevicauda* is more widespread, with known records from eastern Colombia throughout the Llanos, the savannas of the upper Rio Branco in Brazil, Surinam, French Guiana and Guyana. The known altitudinal range varies from sea level to 1,180 m.

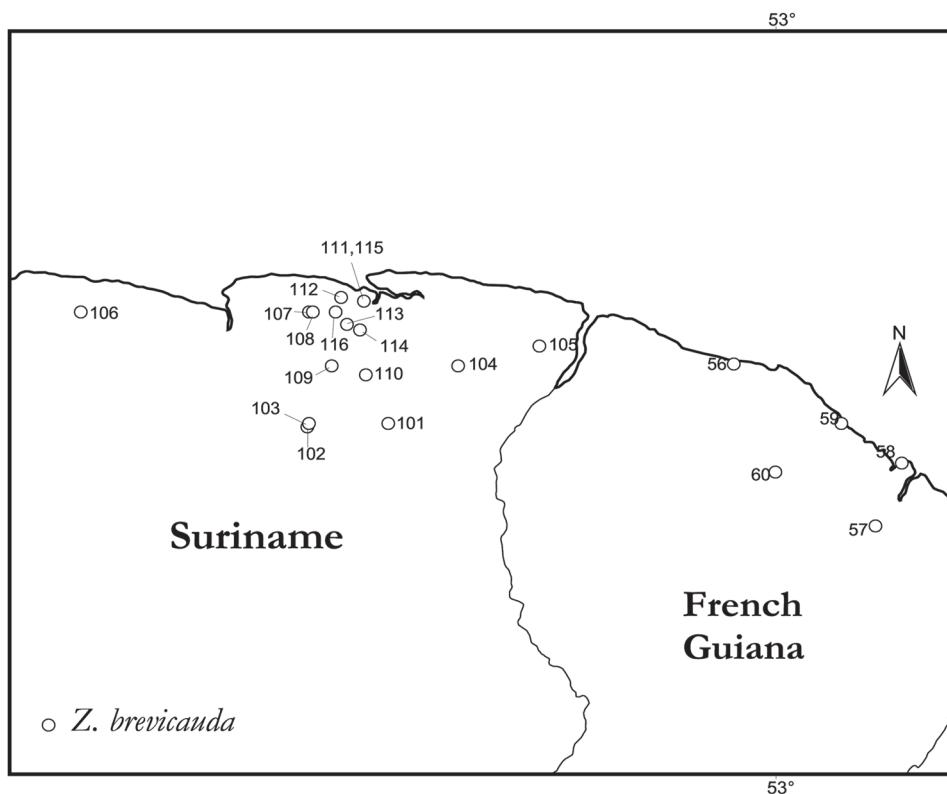

FIGURE 49: Detail of map showing localities for *Zygodontomys*.

Altitudinal Distribution of Tribe Oryzomyini

There are 1,273 localities for which elevation was recorded. Of these, 783 (61.5%) are situated below 999 m; 238 (18.6%) between 1,000-1,999 m; 195 (15.3%) between 2,000-2,999 m; 53 (4.16%) between 3,000-3,999 m; and only two (0.01%) above 4,000 m.

The genus *Microryzomys* occurs at elevations above 4,000 m (maximum limit: *M. altissimus*, collected at Peru, Depart Ancash, Quilcayhuanca, 4,300 m). The genus *Nephelomys* is found in elevations from 800 to 3,999 m. The genera *Aegialomys*, *Handleymys*, *Euryoryzomys*, *Hylaeamys*, *Melanomys* and *Sigmodontomys* are found in the altitudinal gradient from sea level to 2,999 m. The genera *Oreoryzomys*, *Transandinomys*, *Oligoryzomys*, *Sooretamys*, *Cerradomys*, *Zygodontomys*, *Scolomys*, *Mindomys*, *Neacomys*, *Microakodontomys*, *Drymoreomys* and *Oecomys* are found only up to 1,999 m. The genera *Holochilus*, *Nectomys*, *Lundomys*, *Oryzomys*, *Amphinectomys* and *Pseudoryzomys* are found only up to 999 m, probably because most are associated with aquatic environments, mainly floodplains (in open and forested areas) and small forest streams. Most known collection records of *Nesoryzomys*, a Galapagos inhabitant, are from localities at the sea level and of few meters above the sea level (Fig. 50), since virtually all collections of these species have been around the margins of

islands rather than at the rim of central craters; however, there are records of *Nesoryzomys narboroughi*, for example, from the rim of Isla Fernandina's crater, at 1,500 m (J.L. Patton, *pers. com.*).

Being a predominantly forest-specialist group, this decrease in oryzomyine generic diversity across the elevational gradient is not unexpected, as forests are replaced by open physiognomies, such as páramo and puna, at elevations above 3,000-4,000 m. Alternatively, the lower diversity of oryzomyines is countered by the high diversity of thomomysines, and this pattern could be explained by competition between species of these groups (J.L. Patton, *pers. com.*), since members of both tribes are forest specialists. On the other hand, the diversity of open area dwellers, such as members of tribe Phyllotini, transitional and open-area specialists (respectively), exhibit an increase on diversity from lower to higher strata of Andean Cordillera (Steppan, 1995), when compared to adjacent Amazon Forest.

Even on the more limited elevation gradient on the Serra do Mar of eastern Brazil (957 to 2,890 m, with sampling sites between 1,000 and 2,700 m), the same pattern is observed. At the Parque Nacional da Serra do Cipó, five species of Oryzomyini were sampled, including three (*Euryoryzomys rus-satus*, *Nectomys squamipes* and *Sooretamys angouya*) limited to the lower sampling areas characterized by dense forest cover, from 1,000 to 1,400 m, and two

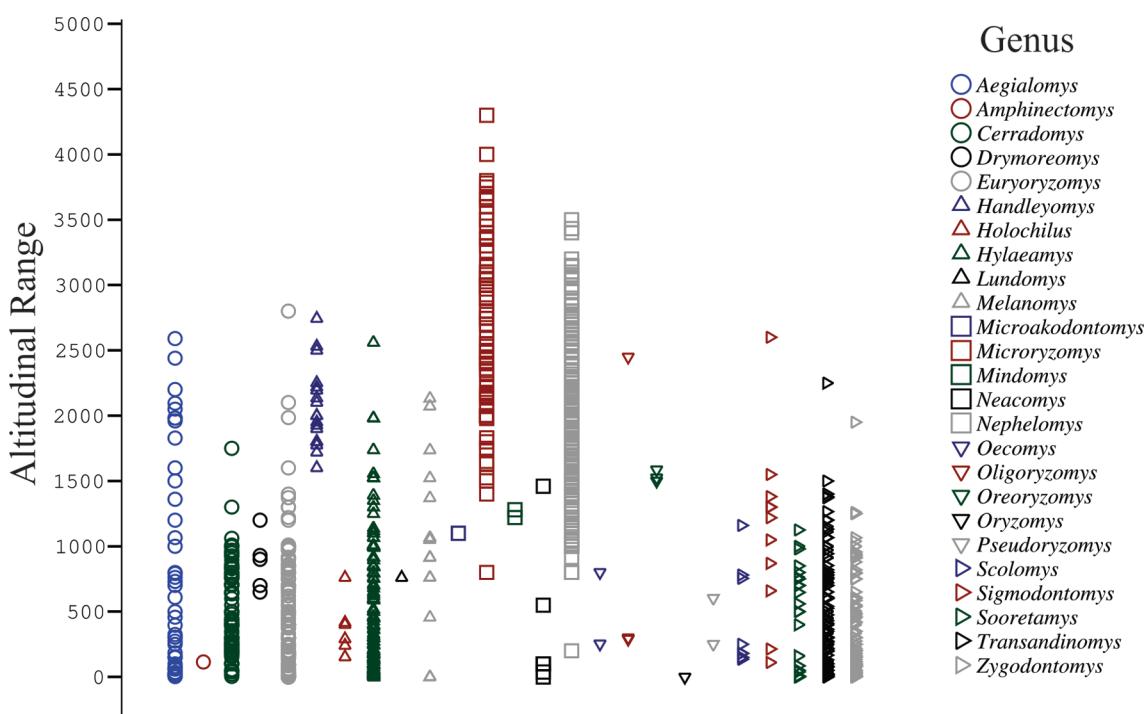

FIGURE 50: Altitudinal variation of collecting localities of the Oryzomyini genera.

(*Oligoryzomys nigripes* and *Oligoryzomys* sp.) with a broader range between 1,100 to 2,000 and 1,800 to 2,400 m, respectively. Along the entire gradient, specimens were captured only in montane forest and mountain scrub (Bonvicino *et al.*, 1997). In contrast, among the Akodontini and Phyllotini, seven species

were captured, four species only above 1,800 m (two undescribed species of *Oxymycterus*, one *Akodon* and one *Calomys*), all captured in montane scrub and humid montane forests, both vegetation types restricted to upper portions of Caparaó mountains (1,800 to 2,700 m).

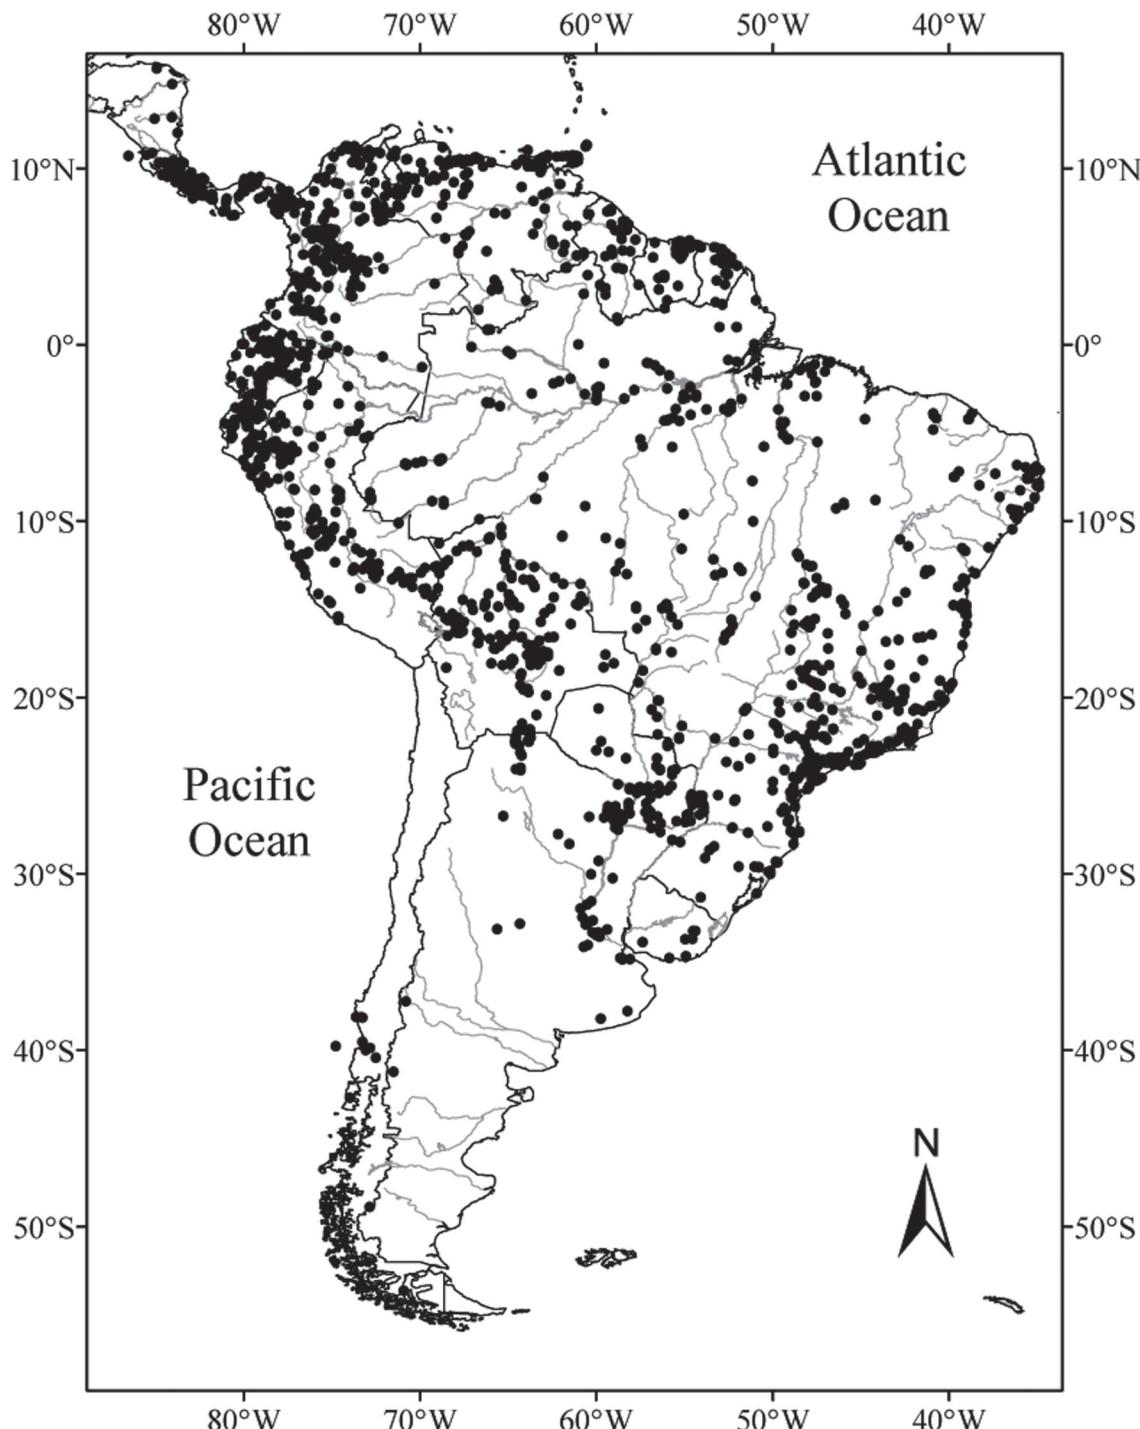

FIGURE 51: Map of collecting localities of Oryzomyini in South America.

Geographic Distribution and Habitat of Tribe Oryzomyini

Large distributional gaps are evident in the map depicting all South American collecting localities of oryzomyine genera and species (Fig. 51). Some of these represent areas in which most oryzomyines are not expected due to inappropriate habitat, such as the open and dry vegetation at the Bolivian and Peruvian Altiplano or the Chilean Atacama desert. On the other hand, since surveys in South America were not performed evenly through the continent, some gaps are artifacts, as those observed on the left bank of Rio Japurá and Pantanal region in Brazil, and eastern portions of Colombia and Ecuador. Therefore, some results presented in this study will likely change as new distribution records become available from future faunal surveys.

Our results indicate three general patterns of distribution for most oryzomyine genera: (1) *Aegialomys*, *Nesoryzomys*, *Oryzomys* and *Sigmodontomys* form a Trans-Andean group, distributed in low- to

moderate-altitude across the Andean Cordillera. Species of this group inhabit humid forests of Colombia (*Sigmodontomys*) and open coastal regions of Peru and Ecuador (*Aegialomys*) and Galápagos (*Nesoryzomys*), and coastal mangroves of Colombia and Venezuela (*Oryzomys*); (2) a group comprised of *Amphinectomys*, *Cerradomys*, *Drymoreomys*, *Euryoryzomys*, *Holochilus*, *Hylaeamys*, *Lundomys*, *Microakodontomys*, *Neacomys*, *Nectomys*, *Oecomys*, *Pseudoryzomys*, *Scolomys* and *Sooretamys* exhibit a Cis-Andean distribution, inhabiting lowland and highland regions of low to moderate elevation; and (3) the genera *Eremoryzomys*, *Handleymys*, *Melanomys*, *Microryzomys*, *Mindomys* and *Oreoryzomys* form a group restricted to the Andean Cordillera, occupying habitats like montane and elfin forests and páramo, from Bolivia to Venezuela. Some genera are not restricted to these three areas, like *Zygodontomys*, which spans all three groups, and the *Transandinomys*, which is distributed in both the Andean and Trans-Andean regions, but without known records on the upper areas of Andean region. Another genus that does not fit to these 3 general patterns is *Nephelomys*,

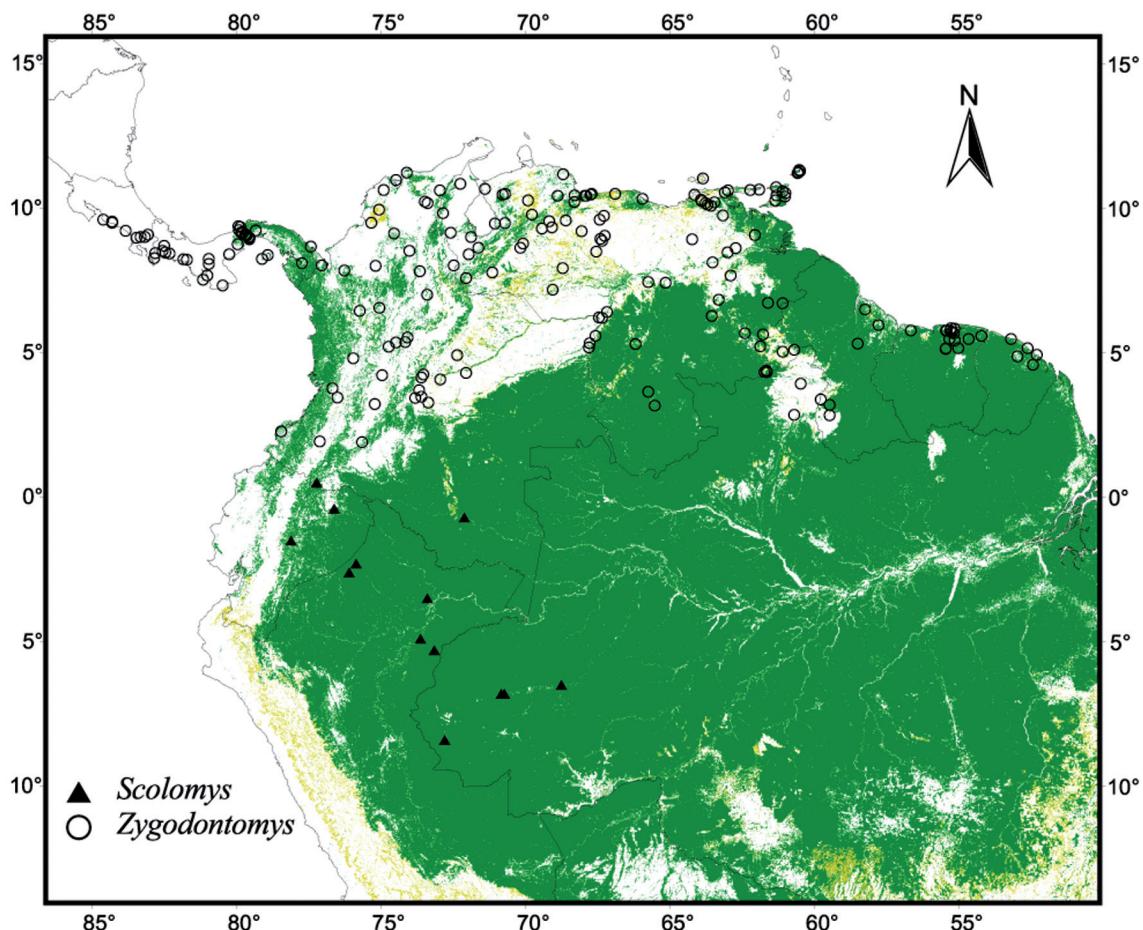

FIGURE 52: Vegetation map showing the collecting localities of the clade A of Oryzomyini phylogeny.

which is predominantly Andean, but also has Trans-Andean records in the Pirre Range on the Panamanian – Colombian border and along the Cordillera Central of Panama and Costa Rica. Although our database for the genus *Oligoryzomys* is incomplete, available information (Paresque, 2010) suggests that the genus exhibit a widespread distribution encompassing Trans-, Cis and Andean areas.

Our results are similar to those presented by Weksler (2006), who stated that most oryzomyine genera were assignable to three general distribution patterns: Trans-Andean, (*Aegialomys*, *Melanomys*, *Sigmodontomys*, *Nesoryzomys* and *Oryzomys*); Andean (including *Microryzomys*, *Handleyomys*, *Mindomys*, *Oreoryzomys* and *Nephelomys*); and Cis-Andean (*ectomys*, *Amphinectomys*, *Holochilus*, *Lundomys*, *Pseudoryzomys*, *Neacomys*, *Oecomys*, *Scolomys*, *Hylaeamys*, *Euryoryzomys*, *Cerradomys*, and *Sooretamys*).

Species of most genera exhibit parapatric and allopatric distributions, and for a few genera, species are widely disjunct, such as *Aegialomys xanthaelous* in coastal Peru and continental Ecuador while its

congener, *A. galapagoensis*, is restricted to the Galápagos Archipelago; *Sigmodontomys aphrastus*, more commonly known from Costa Rica, exhibit a disjunct record in Ecuador.

Some genera are widely distributed throughout South America, like *Euryoryzomys*, *Hylaeamys*, *Holochilus*, *Neacomys* and *Nectomys*, as well *Oligoryzomys* and *Oecomys* (a comparison between the geographic coverage of our database and the type localities of valid species [map not shown] showed that both datasets confirm the widespread distribution of these genera). In contrast, many genera have restricted distributions, including *Amphinectomys*, *Nesoryzomys*, *Drymoreomys*, *Eremoryzomys*, *Handleyomys*, *Microakodontomys*, *Mindomys*, *Oreoryzomys* and *Sigmodontomys*. Finally, other taxa are neither restricted nor widely distributed, like *Aegialomys*, *Cerradomys*, *Melanomys*, *Nephelomys*, *Pseudoryzomys*, *Scolomys*, *Sooretamys*, *Transandinomys* and *Zygodontomys*.

We plotted the clades identified by Weksler (2006) and Percequillo *et al.* (2011) on the updated vegetation map of Eva *et al.* (2002; see Fig. 52 to 55),

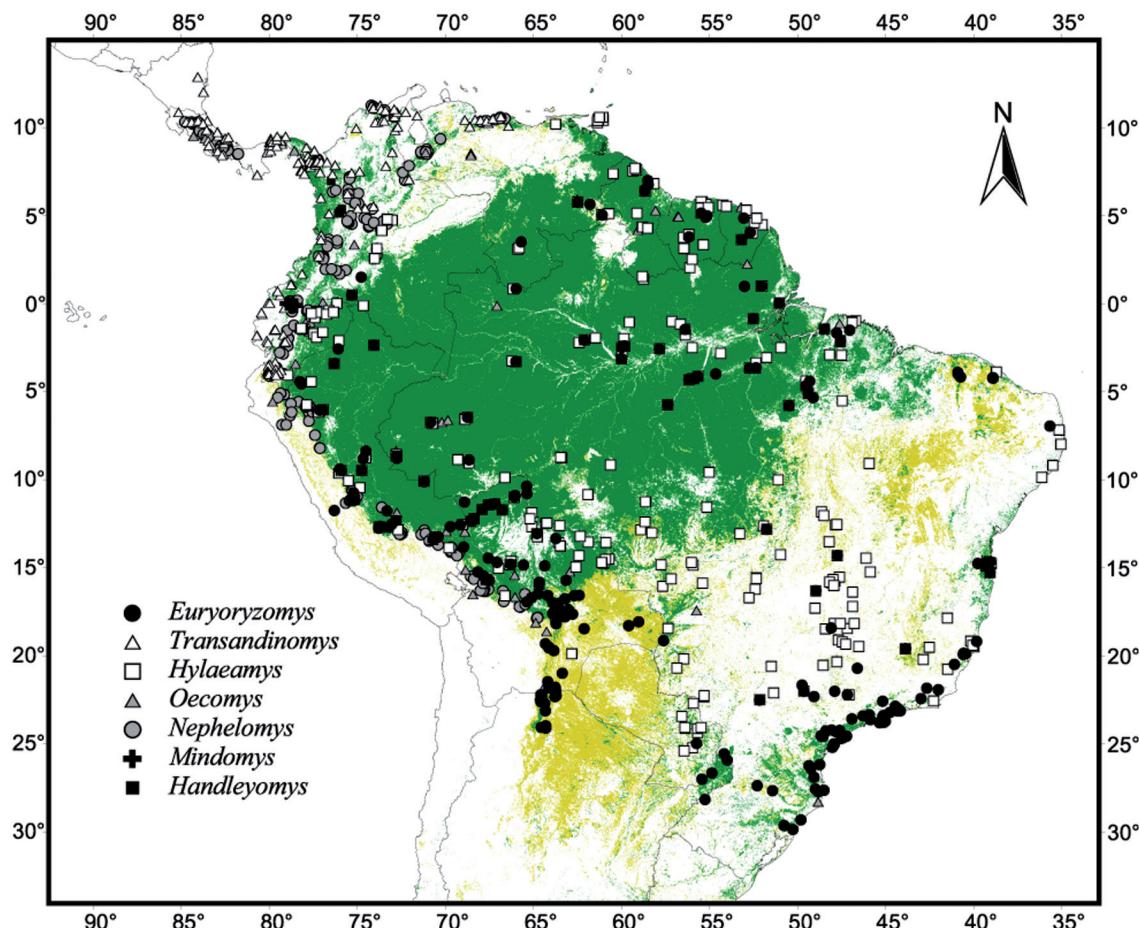

FIGURE 53: Vegetation map showing the collecting localities of the clade B of Oryzomyini phylogeny.

and also mapped habitat as character states on the above mentioned clades using Mesquite software (Fig. 56). According to our results (Fig. 52) clade A is composed by *Scolomys*, one typical lowland forest genus, and *Zygodontomys*, a group that although apparently associated with open habitats (as Venezuelan Llanos and Lavrados [= campos] de Roraima), has localities associated with forest patches (probably occupying ecotonal areas). In clade B, all genera are clearly related with forest habitats, with *Transandinomys*, *Nephelomys*, *Mindomys* and *Handleymys* more associated with humid and montane forests, and *Hylaeamys* and *Euryoryzomys* (and probably *Oecomys*) being found in both humid and dry lowland forests (Fig. 53). In clade C, *Oligoryzomys*, a genus that is certainly ubiquitous occurs across several open areas as well as wet and dry forest, while the genera *Oreoryzomys*, *Microryzomys* and *Neacomys* are present in humid montane (*Oreoryzomys* and *Microryzomys*) and humid lowland forests (*Neacomys*; Fig. 54), although not sharing a common ancestor. Regarding clade D, we have *Aegialomys*, *Oryzomys*, *Lundomys*

and *Nesoryzomys* more affiliated to open areas; *Amphinectomys*, *Drymoreomys*, *Eremoryzomys*, *Melanomys* and *Sigmadontomys* correlated with humid forest; *Ceradomys* is more associated with open areas and dry forest, and also transitional areas; *Sooretamys* and *Nectomys* are restricted to forested habitats both dry and humid, *Holochilus* is apparently more dependent of open grassland and also seasonally flooded grasslands, and *Pseudoryzomys* is inhabitant of open areas, namely seasonally flooded grasslands (campos limpos and campos sujos of Cerrado; Fig. 55). Considering the ancestor of clade D as a forest specialist, the change to transitional and open specialization would have occurred independently at least in five occasions; if we consider the ancestor a open area/transitional dweller, the use of forests would occur four times.

Based on these maps, we can observe that 60,7% (17 genera) of the Oryzomyini genera inhabit mainly forest areas, 32,15% (9 genera) of the genera dwell mainly on open areas, and only 7,15% (2 genera) occupy either areas or even transitional or ecotonal areas. On species level, 62,8% (or 71) are found in

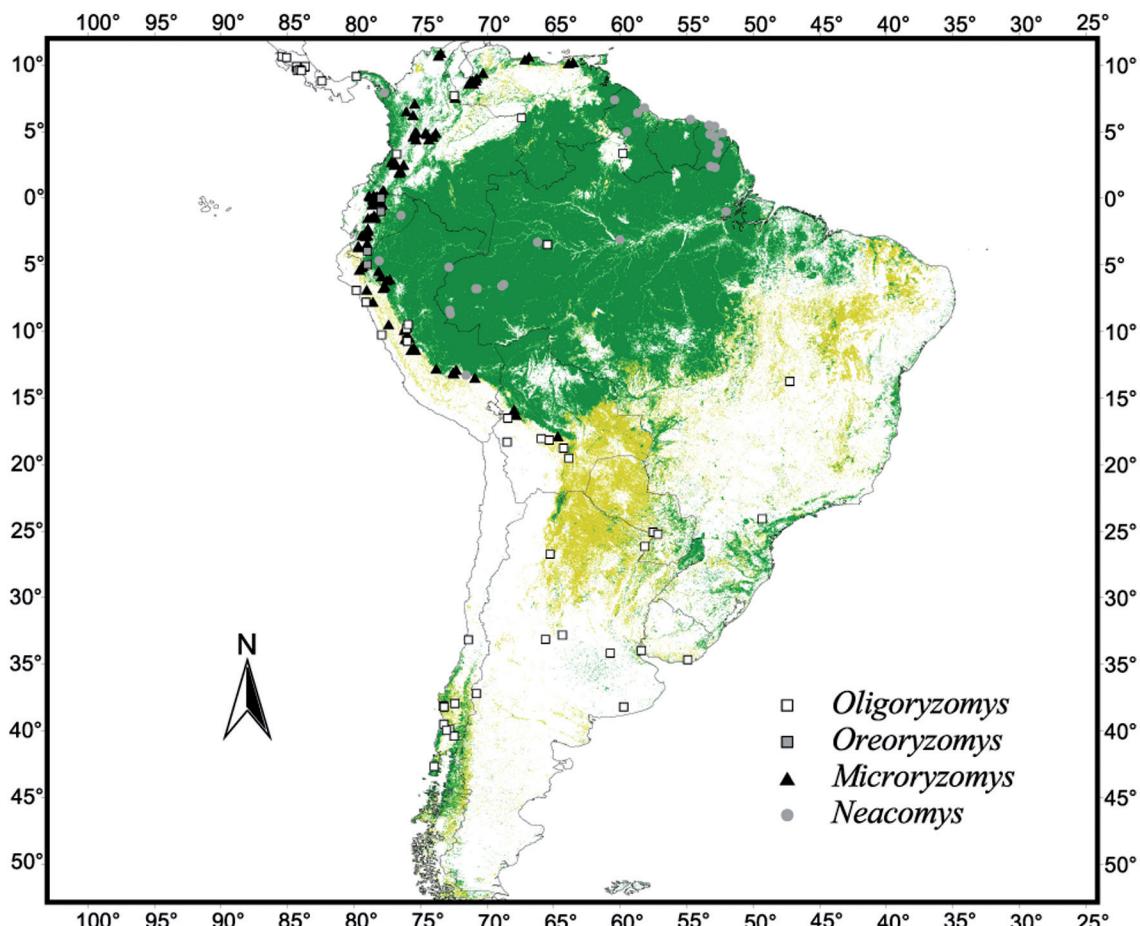

FIGURE 54: Vegetation map showing the collecting localities of the clade C of Oryzomyini phylogeny.

forest habitats, 15% (or 17) of species are distributed throughout open areas and 22,2% (or 25) are found in open habitats and in dry and humid forest (Table 1).

Despite the fact that in our analyses we include more species, these results are similar as Weksler's (2006), who stated that 61% of all oryzomyine species are found exclusively in forest environments and occur in all Oryzomyini lineages, while 28% of species are found in forest and in open vegetation biomes and occur in clades C and D, and 10% of all species are found only in open-vegetation biomes and are found in clades A and D of the tribe phylogeny. Weksler (2006) also suggested that all members of the lineage B are exclusively forest taxa, while the lineage A, C and D contains both types, suggesting that the ancestral oryzomyine was a forest dweller, and that the change to open habitats evolved at least four times in Oryzomyini.

Alternatively, considering that clade A is composed by montane forest and open area inhabitants, being them sister taxa or apparently independent basal clades, and that forest and open specialists are

present in most clades (except in clade B), it is also plausible to hypothesize that the ancestor of oryzomyine was a generalist, with the aptitude to occupy both open and forested habitats, like some species of the genera *Cerradomys* and *Oligoryzomys*. Subsequently, accompanying cyclic climate changes from the late Miocene through present (Smith & Patton, 1999; Steppan *et al.*, 2004) that delineated drastic or subtle vegetation changes (expansion and retraction of forests), different lineages conquered new and different environments. Andean uplift also could explain patterns of distribution of distinct environments and taxa that inhabit them (*e.g.*, Andean, Trans-Andean, and Cis-Andean): the uplift was earlier for the central Andes and more recent for the northern Andes, and both greatly determined, coupled or not to climatic changes, as well as habitat shifts (Simpson, 1975; Hoorn *et al.*, 2010). Nevertheless, regardless of the habitat occupied by the ancestor, the invasion to new environments occurred several times through the evolution of Oryzomyini rodents.

Areas of Original Differentiation

In his study on the biogeography of South American Andean rodents, Reig's (1986) concept of tribe Oryzomyini included 18 genera and based on the distribution of these taxa in the Andean and non-Andean areas, this author found that North Andean region had the greatest representation of oryzomyines, with 14 genera, including five endemic (Table 2). He therefore postulated that Oryzomyini AOD was located in the northern Andes (Ecuador, Colombia and Venezuela).

Aside from several issues that we will discuss subsequently regarding Reig's AODs, a more immediate is the composition of the tribe Oryzomyini. Reig's (1986) concept of the tribe included groups currently assigned to other tribes, such as *Aepeomys*, *Thomasomys*, *Rhipidomys* and *Chilomys* (Thomasomyini), and as *incertae sedis* taxa, such as *Delomys*, *Phaenomys* and *Wilfredomys* (see Table 2). Our results also differs from those obtained by Reig (1986), who recorded 14 genera for the North Andean region, namely *Oryzomys s.s.*, *Oligoryzomys*, *Microryzomys*, *Melanomys*, *Macruroryzomys*, *Sigmodontomys*, *Oecomys*, *Neacomys*,

TABLE 2: Comparison between the generic composition of tribe Oryzomyini according to Reig (1986) and to Weksler & Percequillo (2011), with information on the geographic region of South America inhabited by these genera.

Nectomys, *Aepeomys*, *Chilomys*, *Scolomys*, *Thomasomys* and *Rhipidomys*, and from these, five genera (*Macruroryzomys*, *Sigmodontomys*, *Aepeomys*, *Chilomys* and *Scolomys*) were considered endemic. However, four of these genera (two endemics) belong no more to the Oryzomyini tribe: *Aepeomys*, *Chilomys*, *Thomasomys* and *Rhipidomys* are presently assigned to tribe Thomasomyini (D'Elía *et al.*, 2007). *Macruroryzomys* is a *nomen nudum*, and therefore a new generic name, *Mindomys*, is currently employed for *Nectomys hammondi* (Weksler *et al.*, 2006); despite this nomenclatural issue, Reig was correct in recognize this taxon as a northern Andes endemic. *Sigmodontomys* was found also in Trans-Andean region (McCain *et al.*, 2007) and *Scolomys* was found also in Cis-Andean

region (Gómez-Laverde *et al.*, 2004). Truly, only one of the endemics pointed by Reig is presently recognized as so. Furthermore, Reig's concept of genus *Oryzomys* s.s. (1986) included species that are currently allocated in 10 new different genera (Weksler *et al.*, 2006), bringing important implications regarding diversity patterns: just to mention a few examples, *Oryzomys* is currently a trans-Andean genus, restricted to Colombia and Venezuela (Voss *et al.*, 2001); and the genus *Aegialomys* is predominantly trans-Andean, with most records on the coast of Ecuador and Peru (Prado & Percequillo, 2011). Under the current and more restrictive concept of Oryzomyini (Weksler & Percequillo, 2011), the geographic information assembled by Reig assigns 9 genera to

TABLE 3: Distributional f_T exhibited by each geographical unit. North Andean (NA); Center-North Andean (CNA); Center-South Andean (CSA); North-South Andean (NSA); South of South Andean (SSA); Trans-Andean (TA); Cis-Andean (CA).

the northern Andes, including *Oligoryzomys*, *Microryzomys*, *Melanomys*, *Oecomys*, *Nectomys*, *Neacomys*, with three endemic taxa (*Mindomys*, *Scolomys* and *Sigmodontomys*). We documented the presence of 17 species on the northern Andes, a number similar to that stated by Reig, but with quite distinct composition (Table 2).

Nevertheless, given the substantive advances and changes in our knowledge about the tribe with regard to phylogenetic relationships, generic composition, number of species and geographical distribution in recent years (Musser *et al.*, 1998; Percequillo 1998, 2003; Weksler, 2003, 2006; Weksler *et al.* 2006; Percequillo *et al.*, 2008, 2011), a re-assessment of the patterns of genera and species richness across the South America is needed.

To evaluate areas of generic richness in South America, we used the same methodology (but we separated the Non-Andean region adopted by Reig, into Cis- and Trans-Andean) and added data from current distribution of genera of the tribe Oryzomyini.

The Table 3 provides distributional f_T by geographical unit, as well the location of areas of highest richness and greatest generic endemism for the tribe. The North Andes contain 14.7% (or 354 records) of all collecting localities; 4.8% (or 116 records) are in the North-Central Andean region; 2.4% (or 60 records) are in the South-Central Andean region; 64.2% (or 1,557 records) are located in the Cis-Andean region; and 13.9% (or 339 records) are in the Trans-Andean region. The number of localities in both North-South Andean (no records) and South-Southern Andean (just one record) regions are insignificant (these number would change with a more robust database for genus *Oligoryzomys*, the only Oryzomyini genus known to occur in these areas). Regrettably it is impossible to compare our data on number of records with those published by Reig, even considering only the same oryzomyine genera present in both database, since Reig (*op. cit.*) does not provide the number or frequencies of collecting localities for each genera, only the total observed for the tribe.

The large number of records from the Cis-Andean region is due mainly to the very abundant taxa *Euryoryzomys*, *Hylaeamys* and *Cerradomys*, as well as the high number of genera (18), nine of which are endemic (*Amphinectomys*, *Cerradomys*, *Drymoreomys*, *Euryoryzomys*, *Hylaeamys*, *Lundomys*, *Microakodonotomys*, *Pseudoryzomys*, *Sooretamys*) and the larger number of species, 47, of which 37 are endemic. It is important to notice that genus *Scolomys*, considered an endemic of the northern Andes by Reig (1986), exhibit Cis-Andean distribution (in fact, most records are of Cis-Andean distribution). Part of the great representation of taxa and localities within the Cis-Andean region is likely due to the combination of large extension and presence of most of the major habitats of South America, including the Amazon and Atlantic Forests, Cerrado, Caatinga, Pantanal, Pampas and Chaco (just to mention areas in which oryzomyines occur); another possible reason for this great number of records is due to non uniform collecting throughout South America.

The North Andean region also exhibits a large number of records (354 or 14.7%), being *Nephelomys* and *Microryzomys* the most abundant taxa. In addition to these two, another 15 genera inhabit the northern Andes (*Handleyomys*, *Mindomys*, *Oreoryzomys*, *Aegialomys*, *Transandinomys*, *Melanomys*, *Scolomys*, *Holochilus*, *Neacomys*, *Nectomys*, *Oligoryzomys*, *Sigmodontomys*, *Oecomys*, *Zygodontomys* and *Oryzomys*), from which only two are endemic (*Handleyomys* and *Mindomys*); there are 48 species in this region, being 36 endemic species.

The relatively large number of Trans-Andean records (339 or 13.9%) result from the abundant genera *Transandinomys* and *Aegialomys*, but nine other genera inhabit this region as well (*Melanomys*, *Neacomys*, *Nephelomys*, *Nesoryzomys*, *Oryzomys*, *Sigmodontomys* and *Zygodontomys*; *Oecomys* and *Oligoryzomys* also exhibit Trans-Andean records); 7 species (*Nephelomys devius* and *N. pirrensis*, *Nesoryzomys darwini*, *N. fernandinae*, *N. swarthi* and *N. indefessus*, and *A. galapagoensis*) and one genus (*Nesoryzomys*) are endemic to this area.

Reig (1986) reported that 68.5% of the occurrences of oryzomyines are distributed throughout the Andes. This statement does not correspond to our results, since only 21.87% (or 531) of the localities analyzed in this study are located in Andean regions. This difference is probably due to the time window between the two studies: in this interval of time, many wildlife surveys have been conducted increasing the number of records and new taxa of the tribe and new phylogenetic relationship hypothesis have also

changed the taxonomic composition of Oryzomyini. But we can also assume that the Reig's sample may have been biased, prioritizing the Andean regions more than the non-Andean ones, since his main objective was to evaluate Andean biogeography. However, as stated above, we are unable to directly compare our results, since Reig's database is not available.

The AOD (Reig, 1986) also deserves further comment, given the recent published phylogenies of oryzomyines, by addressing the relationship between the geographic distributions of taxa with their phylogenetic patterns (Percequillo *et al.*, 2011). The 17 genera present in the northern Andes are distributed throughout the Oryzomyini clade: *Scolomys* and *Zygodontomys* are located in the clade A; the genera *Handleyomys*, *Transandinomys*, *Nephelomys*, *Mindomys* and *Oecomys* are located in the lineage B; the genera *Oreoryzomys*, *Microryzomys*, *Neacomys* and *Oligoryzomys* are located in clade C; the genera *Aegialomys*, *Melanomys*, *Oryzomys*, *Nectomys* and *Sigmodontomys* are located in the lineage D. If the northern Andes were the AOD of this tribe, we would expect that the most basal or more derived oryzomyine genera would occur predominantly or exclusively in this region, a pattern not recovered in any phylogeny.

Scolomys and *Zygodontomys* form a monophyletic group of the major lineage A (Maximum Parsimony tree) and exhibit Cis-Andean/north Andean and Trans-Andean/north Andean/Cis-Andean distributions, respectively; perhaps these two genera inhabited the north Andean or the Cis-Andean areas before the uplift of the Andes, since they represent common areas inhabited by both (or the common ancestor). If northern Andes inhabitants, after the uplift *Scolomys* dispersed to the eastern part of the Andes, but remained restricted to western portion of Amazon Basin, while *Zygodontomys* dispersed both to Cis- and Trans- part of the Andes.

The genera *Nephelomys*, *Mindomys*, *Oecomys*, *Handleyomys*, *Hylaeamys*, *Transandinomys* and *Euryoryzomys* belong to clade B and have totally different patterns of distribution, being *Hylaeamys* and *Euryoryzomys* widely distributed through the cis-andean part; *Nephelomys* widely distributed throughout the Andes (northern, center-north and center-south); *Handleyomys* and *Mindomys* are restricted to northern Andes; *Transandinomys* widely distributed through the trans-andean part, and *Oecomys* occurring on both sides of Andes. The Andean genus *Nephelomys* is the basal lineage in this clade; another internal clade is composed by an Andean endemic, *Mindomys*, and by a widespread genus, *Oecomys*; the next internal clade gathers *Handleyomys intectus*, another Andean endemic, and

species of the *alfaroi* group, a trans-Andean lineage; this previous group is sister to a clade containing (*Hylaeamys* (*Transandinomys*, *Euryoryzomys*)), being the first and the latter cis-Andean taxa and *Transandinomys* a trans-andean group.

In the clade C, *Neacomys*, a cis-Andean genus, is sister to a clade formed by two Andean dwellers (*Microryzomys* and *Oreoryzomys*) and by *Oligoryzomys*, a widespread genus, occurring from North America to extreme South America. The clade D assembles several genera: *Pseudoryzomys*, *Holochilus*, *Lundomys*, *Oryzomys*, *Sigmodontomys*, *Melanomys*, *Sooretamys*, *Eremoryzomys*, *Drymoreomys*, *Cerradomys*, *Aegialomys*, *Nesoryzomys*, *Amphinectomys* and *Nectomys*. *Pseudoryzomys*, *Holochilus* and *Lundomys*, all inhabitants of open areas of cis-Andean region, form one clade, that is sister to a clade that contains *Oryzomys*, a trans-Andean group, *Sigmodontomys* and *Melanomys*, both Andean and trans-Andean genera. These two clades form a clade that is sister to another inclusive clade that includes two monophyletic groups, one formed by *Sooretamys*, *Eremoryzomys* and *Drymoreomys*, groups from the Atlantic Forest and Andes (*Eremoryzomys*); the other clade is formed by *Cerradomys*, a Cis-Andean genus; *Aegialomys* and *Nesoryzomys*, trans-Andean genera that reached Galapagos Islands; and *Amphinectomys* and *Nectomys*, cis-Andean forest inhabitant genera.

Concluding, the original AOD proposed by Reig (1984, 1986) for the tribe Oryzomyini in the northern Andes, based on frequency of occurrence of genera, is falsified since most records are currently associated with Cis-Andean region. Our results suggest that frequency of occurrence is not an adequate method to identify "the geographic space within which a give taxon experienced the main differentiation (cladogenesis) of its component taxa of subordinate rank." Despite the theoretical corollaries elaborated by Reig to define his AOD's, his methodological approach was not different from those authors trying to identify Centers of Origin. Although these issues do not invalidate the concept of AOD, our contrast between geography and phylogeny weaken Reig's assumptions (1986:411): neither the northern Andes, nor any other area in South America, can be identified as "areas reached by the ancestral stock after its dispersal from the AOD of its parental taxon", "the area where the taxon split most actively into subordinate taxa," or "the area in which the taxon split into apomorphic species, which dispersed into a new AOD to generate there a new sister taxon of the same rank." Any area where a cladogenetic event between two sister clades (two genera) took place would be

recognized as an AOD for the tribe, if the several sister genera inhabit distinct habitat types.

Considering the patterns described above, it is clear that any possible biogeographic explanation will be very complex, as vicariant events, dispersal, and extinction all likely contributors to the origin and distribution of taxa. One major problem is that although consistent, the existing phylogenetic hypotheses for the tribe remain preliminary, with different trees obtained by Weksler (2006) and Percequillo *et al.* (2011) employing the same data set, with addition of new taxa (e.g., *Drymoreomys*) and new molecular characters (cyt-b), as well re-interpretations of some morphological character states. Although the same four clades were consistently obtained, the topology within each lineages varies significantly, obscuring any biogeographic hypothesis.

Diversity Patterns and Endemism

Some areas of the northern Andes acted as both historical and present geographical barriers to fauna dispersal (Duellman, 1979; Simpson, 1979). Examples include the Huancabamba depression, a complex system of mountain and low inter-Andean watersheds in northern Peru (Duellman, 1979); the frontier between Colombia and Venezuela, where the Cordillera Oriental and the Sierra Nevada de Mérida are separated by lower areas, and the Sierra Nevada de Mérida is separated from the Coastal Cordillera by the Barquisimeto depression (Duellman, 1979); the Nudo de Pasto area, on the Ecuadorean and Colombian border (Simpson, 1979); the Sierra Nevada de Santa Marta, which is isolated from the Serranía de Perijá by a narrow arid area; the dry valley of the Rio Cauca (Duellman, 1979); and the Rio Magdalena valley (Simpson, 1979). Reig's Andean areas are largely coincident with the limits of each of these biogeographical breaks. Several areas or centers of endemism proposed by Cracraft (1985) also are coincident with these areas and delimited by these barriers through the Andes (mostly associated fo northern Andes), namely the Magdalena, Venezuelan Montane, Meridan Montane, Santa Marta, Perijan Montane, North Andean, Peruvian Andean Centers (these last two limited by Huancabamba depression). Most of these barriers are associated with the complex geological history of the northern Andes, which result from recent episodes of orogeny in just the past few million of years, a time-line that is likely correlative with oryzomyine diversification. According to several authors (Simpson, 1975; Hoorn *et al.*, 1995, 2010)

some portions of the Andes, such as the Altiplano and Cordillera Oriental, and Occidental of Peru, began to uplift during the Cretaceous. However, for the northern Andes, mountain building started by the late Oligocene to early Miocene (*ca.* 23 M.y.), but the most intense orogenic activity occurred: during the late middle Miocene (*ca.* 12 M.y.), with the uplift of Eastern Cordillera; during the late Miocene, when the present Andean configuration was nearly formed (causing Rio Orinoco to change its course, and Rio Amazon to establish a connection with the Atlantic Ocean); during early Pliocene (*ca.* 4.5 M.y.), with the uplift of Serra Nevada de Santa Marta; and during the Pliocene (*ca.* 3.5 M.y.), with the formation of the Isthmus of Panama. According to Steppan, (1995), the ancestor of Oryzomyalia (the clade that includes all Sigmodontinae, but Ichthyomysini and Sigmodontini) reached South America by 6 M.y. (late Miocene), and its tribes started diversification during the next million years. Thus, the Andean orogenesis and the climatic and vegetational changes derived from such change in the landscape were partly experienced by Oryzomyini lineages: the uplift of the Eastern Cordillera is the last event of Andean uplift around 12 M.y., and this range is “high enough to permanently divide the former foreland basin into the Magdalena [draining to Caribbe] and Llanos basin [draining to Rio Orinoco]...” (Hoorn *et al.*, 1995). Apparently the Cis and Trans-Andean separation of Oryzomyini lineages was due to dispersion through some lowland areas that bisects the Andes (Huancabamba Depression and Barquisimeto Depression) rather than to vicariance. However, the presence of genus *Zygodontomys* only on the north bank of Rio Amazonas is consistent with the long isolation of this Guianan shield area by the Amazon Lake (during early Miocene), and latter by the Rio Amazonas (during late Miocene and Pliocene).

In addition to the Andean centers, Cracraft (1985) also recognized other centers in South America: Imeri, Napo, Inambari, Rondônia, Pará, Guyanan, Serra do Mar and Paraná Centers, among others. The areas of greatest species richness of tribe Oryzomyini are greatly concordant with several of these centers: figures 57 and 58 illustrate areas of densest sampling and species richness throughout South America, respectively. It is noteworthy that areas with the densest sampling are frequently coincident with areas with more species and areas of endemism, a similar and frequent criticism to refugia in Amazonia (Nelson *et al.*, 1990; Bush & Oliveira, 2006). This could be a consequence to the fact that systematists and biogeographers generally focus on areas of contact or parapatry

while trying to delineate species boundaries and areas of endemism, respectively (J.L. Patton, *pers. com.*). For oryzomyines, areas of greatest species richness are located mainly in the Andes, followed in smaller degree by areas in the Guianan Shield, Brazilian Atlantic Forest, Amazon Forest, and Paraguayan Chaco (10-13 species). Twenty one species are found in a three degree rectangle, near the Ecuadorean and Colombian border, which roughly corresponds to Cracraft's and Reig's North Andean Center: *Aegialomys xanthaeolus*, *Hylaeamys perenensis*, *H. yunganus*, *H. tatei*, *Melanomys caliginosus*, *M. robustulus*, *Microryzomys altissimus*, *M. minutus*, *Mindomys hammondi*, *Nectomys apicalis*, *Nephelomys albicularis*, *N. auriventer*, *N. nimbosus*, *N. moerex*, *Oecomys bicolor*, *O. superans*, *Oreoryzomys balneator*, *Scolomys melanops*, *Sigmodontomys aphras-tus*, *Transandinomys bolivaris*, and *T. talamancae*. Some species are primarily Cis-Andean (*Hylaeamys perenensis*, *H. yunganus*, *Nectomys apicalis*, *Oecomys bicolor*, *O. superans*, *Scolomys melanops*) or Trans-Andean (*Transandinomys bolivaris* and *T. talamancae*), but with their distributional limits near or coincident with the limits of this rectangle. A second, contiguous southern grid, partially included in Cracraft's (1985) Peruvian Center involves 17 species, several of which are shared with the Ecuador-Colombian rectangle but others that are exclusive (such as *Eremoryzomys polius* and *Melanomys robustulus*).

The area of high oryzomyine richness in the Guyana Shield is included in the Guyanan Center of Cracraft (1985), with 10 species: *E. macconnelli*, *H. megacephalus*, *H. yunganus*, *Neacomys dubosti*, *N. paracou*, *Nectomys ratus*, *O. speciosus*, *O. trinitatis*, *O. auyantepui*, and *Z. brevicauda*. At present, species endemic to this area are *N. dubosti* and *N. paracou*. Other areas of high richness in South America are associated with other well-known centers of endemism, such as the Napo (7 species) and Imeri (11 species) in the Amazon Basin, and the Serra do Mar in the Atlantic Forest (11 species). We also detected an area of high richness in eastern Paraguay that does not correspond to any described area of endemism or species richness, with 12 species from open (*P. simplex* and *H. sciureus*), forest (as *S. angouya* and *H. megacephalus*), and transitional areas between open and forested habitats (*C. scotti*). Apparently this mixture of open and forest faunas could explain the moderate number of species in eastern Paraguay.

Even with the best geographic coverage for most genera of the Oryzomyini for Cis-Andean South America (see discussion above), the northern Andean (as well as center-north and center-south areas) still harbors the highest species richness within the tribe.

One of the causes of the great diversity of oryzomines in the Andean region may be linked to the great diversity of forested habitats in this region related to altitudinal gradient allied to topographic diversity, which dictates habitat diversity, even locally, as well as differences in slope exposure in narrow valleys, and valley orientation relative to down-slope moisture gradients, extending from the highlands to both trans-Andean and cis-Andean areas (J.L. Patton, *pers. com.*). This changes environmental characteristics (*e.g.*, the type of forest, as lowland forest, montane forest, elfin forest) and the selective pressures acting on these rodent populations (Endler, 1982).

The Andean region has been called a transition zone in South America (Morrone, 2006). According to Morrone (2004), transition zones are generally located in the contact borders between biogeographic regions and represent biotic hybridization events promoted by historical and ecological changes that allow the overlapping of different biotic components. These regions can either have an impoverished biota or a high diversity. Our data does not support this assumption, since the Andes harbor a great diversity of endemic taxa (genera and species) and, as such, is a distinct biogeographic region, even if it is not a Center of Origin or AOD for oryzomyine rodents. Moreover, phylogenetic data available (Weksler, 2006; Percequillo *et al.*, 2011) show that Andean lineages are not the product of hybridization between taxa from contiguous biogeographic regions.

Valencia-Pacheco *et al.* (2011), evaluating patterns of diversity for the tribe, reported the existence of a latitudinal gradient in the number of species of Oryzomyini with a marked decrease in diversity towards the south and northwards from the Amazon Basin, and together with the Amazon comprises the most diverse area of South America. In their Source-Sink model, the Amazon region has served as a "source" (a kind of 'center of origin' for the tribe) from which species dispersed and colonized new environments. Our data (Fig. 58) also show a high diversity of species between 0° and 10°S latitude, however this diversity is more related to the Andean region and not the Amazon region as assumed above. The difference between these two perspectives results from the method employed by Valencia-Pacheco *et al.* (2011), one that divides South America in latitudinal slices, with each slice including several biomes, each with its distinct faunal components. Moreover, the recognition of the Amazon as the source or center of origin for the tribe is not concordant with the phylogenetic hypotheses currently available, as we demonstrated above. Weksler (2006) stated that his results were

inconclusive, but he suggested that either the Amazon or Andes could represent the differentiation site of Oryzomyini. Nevertheless, Valencia-Pacheco *et al.* (2011) disregarded Weksler's statement and arbitrarily selected the Amazon as the source for the tribe. Fairly, even the most robust dataset on distribution and diversity presented in this paper does not allow us to infer that the Amazon would be the "starting point" of the tribe distribution on the continent, since several areas in South America exhibit high diversity and could also qualify as "starting point" candidates for tribe Oryzomyini.

In addition to the general patterns of diversity observed in the Andes region, the hypothesis suggested by Reig (1986) about the origin and differentiation of the Oryzomyini tribe also provides explanations for the great diversity of the tribe in the same region. According to Reig the proto-oryzomyine invaded South America through waif-dispersal coming from Central America and probably dispersed quickly in the early Miocene over the Andes, because at that time they found good conditions there to settle. The subsequent rise of the Andes during the Miocene, forming the eastern Cordillera of Colombia and Venezuela and the western Cordillera of Colombia and Ecuador, had increased the heterogeneity of the Andean environments throughout the late Tertiary, resulting in the differentiation of the tribe (Reig, 1986). Despite all criticisms to Reig's AOD hypothesis, it is noteworthy that recent phylogenies (Smith & Patton, 1999; Weksler, 2003, 2006; Steppan *et al.*, 2004; Percequillo *et al.*, 2011), new data on the fossil record (Pardiñas, 2008; Verzi & Montalvo, 2008), and new evidence on Andean orogeny (Hoorn *et al.*, 1995, 2010) are concordant with the Reig hypothesis (1984, 1986) regarding the timing of arrival of Sigmodontinae in South America; hypotheses on the patterns and processes of diversification for this group are still very preliminary (Patton *et al.*, 2000; Costa, 2003; Almeida *et al.*, 2007; Barros *et al.*, 2009; Smith *et al.*, 2001; Miranda *et al.*, 2007; among others), but evidence so far suggests a much more complex scenario than that envisioned by Reig.

Final Considerations

We believe that we have demonstrated that most flaws or inadequacies observed in most of the hypothesis addressed above (Reig, Hershkovitz, Valencia-Pacheco) are a consequence of incomplete knowledge on the geographic distribution of genera and species of tribe Oryzomyini. This study shows a considerably

greater species richness when compared to the results of Reig (1986), based on the more robust database (new taxa, new localities, new taxonomic arrangement), providing more credibility to the conclusions we infer.

One hypothesis to explain the distribution pattern of the Oryzomyini may be an adaptive radiation in

which they formed, in a short time, several species from a single ancestral species. From these groups split off and dispersed to different regions, occupying free ecological niches, giving rise to several different lineages. Although Reig's AOD is debatable, based on the arguments we have presented above and the strength of current vicariance

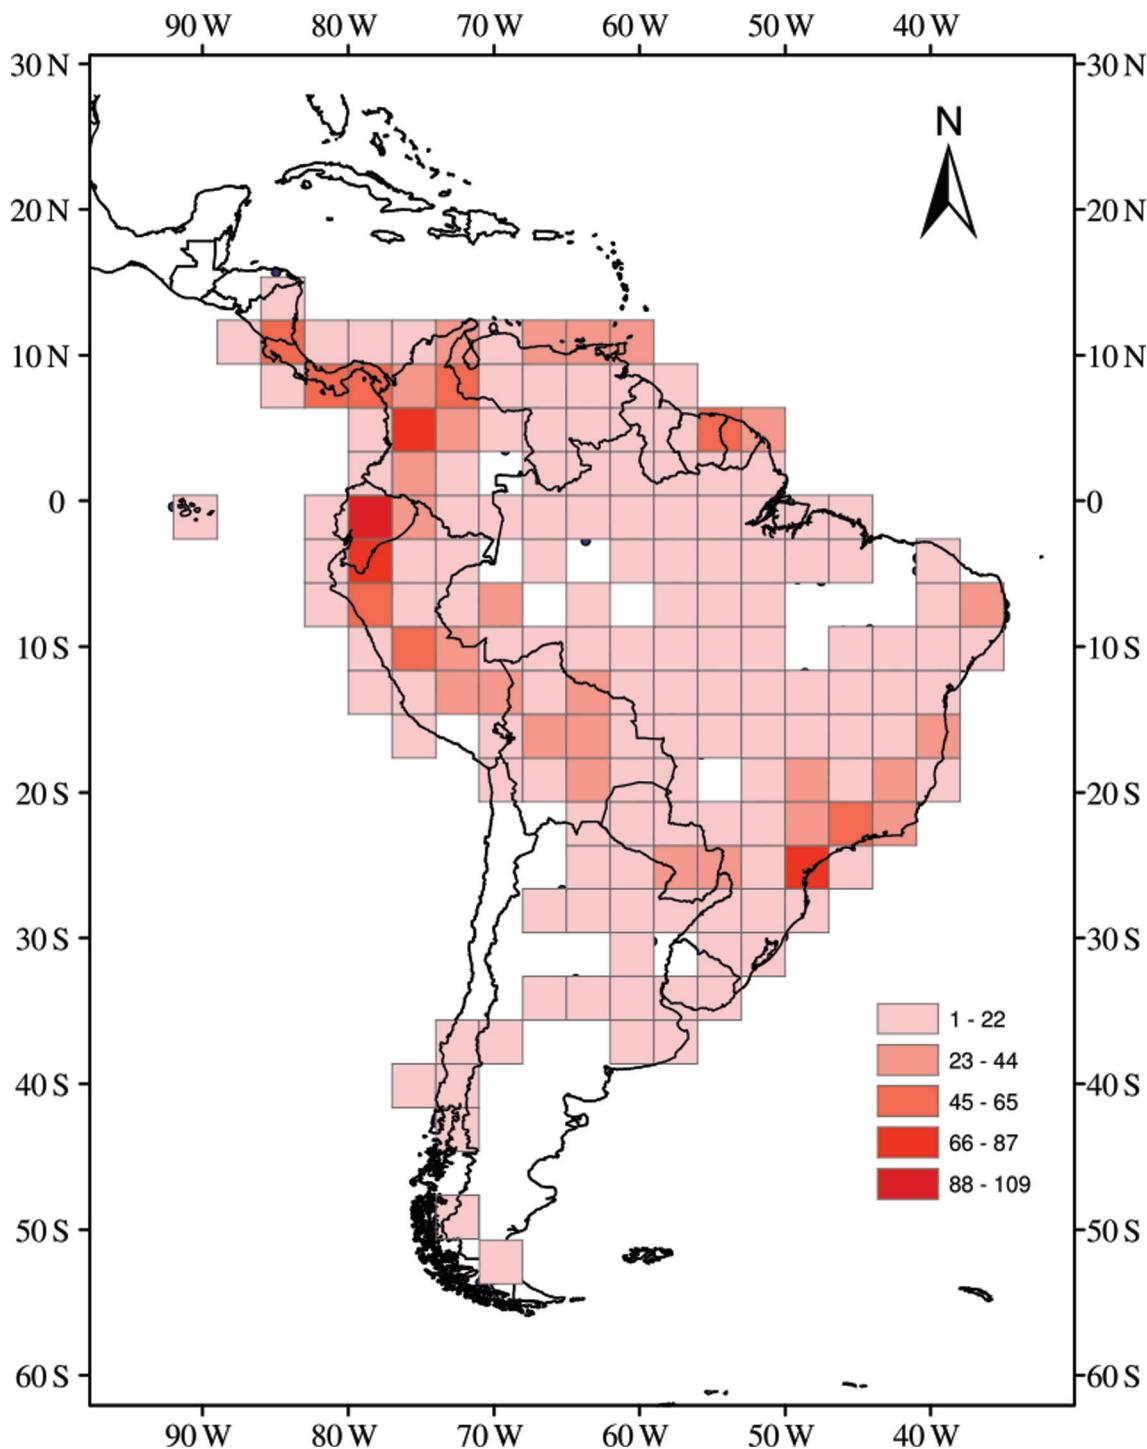

FIGURE 57: Map illustrating areas of sampling density throughout South America. The gradient color corresponds to the number of records.

biogeography theory, Reig was correct in his identification of the northern Andes as an area of great diversity.

Considering the concepts and the criticism about centers of origin and AODs, or other hypotheses regarding origin and dispersal (Willis, 1922; Kinsey, 1936; Cain, 1944; Croizat *et al.*, 1974; Nelson &

Rosen, 1981; Reig, 1986; Bremer, 1992), we agree that connecting phylogenetic studies to a comprehensive database on the distribution of a group is essential in uncovering both the pattern and process of history (*e.g.*, Simpson 1980; Nelson & Platnick, 1981; Reig, 1981; Wiley & Mayden, 1985; Humphries & Parenti, 1986;

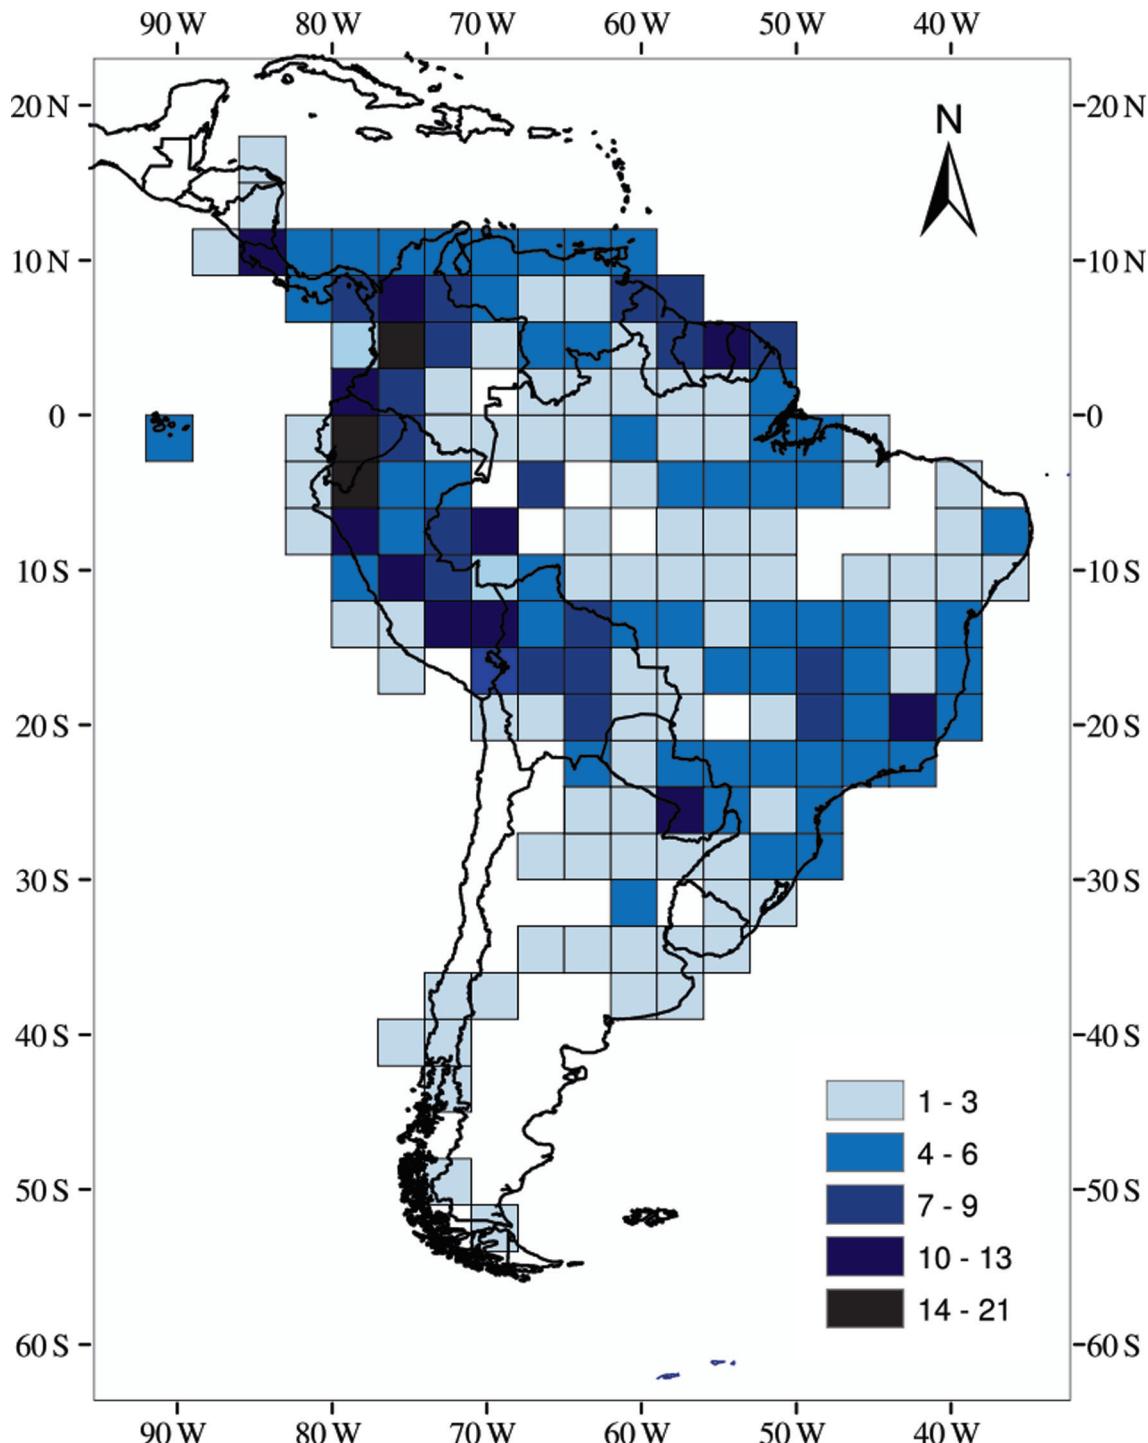

FIGURE 58: Map illustrating areas of species richness throughout South America. The gradient color corresponds to the number of species.

Mayden 1987, 1992; Silva & Patton, 1993; Bush, 1994; Patton *et al.*, 1994; Riddle, 1996). In this paper we describe patterns of current diversity and distribution, through the comparison of distributional data with available phylogenies, thus contributing to the knowledge of the biogeography of tribe Oryzomyini.

RESUMO

Oryzomyini é a tribo mais diversa dentro da radiação da Subfamília Sigmodontinae, com 28 gêneros e aproximadamente 130 espécies viventes, sendo essa diversidade refletida na variação ecológica e morfológica exibida pela tribo. Existem várias hipóteses para explicar o surgimento e a diversificação da subfamília Sigmodontinae na América do Sul, entre elas as áreas de diferenciação original (ADO). Este trabalho fornece informações a respeito da distribuição geográfica de todos os atuais táxons do grupo do gênero da Tribo Oryzomyini sendo estes organizados em índices de localidades com os registros de distribuição (coleção de localidades, estado ou província, país), altitude e coordenadas geográficas. Mapas das localidades de coleta foram elaborados para os gêneros e as espécies e estes foram utilizados como referência para mapear os padrões de distribuição geográfica e de riqueza, além testar a hipótese de ADO da tribo Oryzomyini, a qual advoga que este grupo se originou e se diferenciou no norte dos Andes. Nossos resultados revelam uma considerável riqueza genérica e específica e mostra a existência de três padrões gerais de distribuição, o Trans Andino, o Andino e o Cis Andino. Além do mais, diferentes gêneros apresentam a maioria dos principais tipos de distribuição, como endêmicos, disjuntos, amplamente distribuídos e restritos, e habitam diferentes ambientes desde florestas a áreas abertas. Hipóteses filogenéticas recentes indicam que os padrões de distribuição dos orizomíneos não mostram correspondência com as linhagens principais do clado Oryzomyini, pelo contrário, cada linhagem principal da tribo exibe a maioria dos padrões biogeográficos descritos anteriormente. A região norte-andina não pode ser considerada como ADO, uma vez que a maioria dos registros para a tribo está localizada na região Cis Andina. A segunda região mais diversa é a Norte andina e a região Trans Andina é a terceira mais rica em número de espécies. Os padrões de riqueza da Tribo Oryzomyini são concordantes com vários centros e regiões de endemismos descritos na literatura. Áreas de grande riqueza estão localizadas principalmente nos Andes, seguidos em menor grau por áreas do escudo guianense, Floresta Atlântica, Amazônia e o Chaco Paraguaio.

PALAVRAS-CHAVES: Oryzomyini; Distribuição Geográfica; ADO; Biogeografia.

ACKNOWLEDGEMENTS

We wish to express our thanks to the curators and staff of the museums and collections enlisted above for allowing us to study specimens under their care. We are deeply indebted to M. de Vivo and A.P. Carmignotto for reviewing a previous version of this manuscript: their valuable and inspiring comments and suggestions greatly improved this contribution; Alfredo Langguth and James L. Patton also provided important criticism; needless to say that any errors that may remain are, of course, our own. Our research was supported by Fundação de Amparo à Pesquisa do Estado de São Paulo (FAPESP 1998/12273-0, Programa Biota 1998/05075-7; FAPESP 2009/03547-5; FAPESP 2009/16009-1), CNPq (2008/476249) and CNPQ/PIBIC scholarship, as well as grants from the American Museum of Natural History, the Field Museum, the Smithsonian Institution, the Museum of Comparative Zoology.

INSTRUCTIONS TO AUTHORS - (April 2007)

General Information: *Papéis Avulsos de Zoologia (PAZ)* and *Arquivos de Zoologia (AZ)* cover primarily the fields of Zoology, publishing original contributions in systematics, paleontology, evolutionary biology, ontogeny, faunistic studies, and biogeography. *Papéis Avulsos de Zoologia* and *Arquivos de Zoologia* also encourage submission of theoretical and empirical studies that explore principles and methods of systematics.

All contributions must follow the International Code of Zoological Nomenclature. Relevant specimens should be properly curated and deposited in a recognized public or private, non-profit institution. Tissue samples should be referred to their voucher specimens and all nucleotide sequence data (aligned as well as unaligned) should be submitted to GenBank (www.ncbi.nih.gov/Genbank) or EMBL (www.ebi.ac.uk).

Peer Review: All submissions to *Papéis Avulsos de Zoologia* and *Arquivos de Zoologia* are subject to review by at least two referees and the Editor-in-Chief. All authors will be notified of submission date. Authors may suggest potential reviewers. Communications regarding acceptance or rejection of manuscripts are made through electronic correspondence with the first or corresponding author only. Once a manuscript is accepted providing changes suggested by the referees, the author is requested to return a revised version incorporating those changes (or a detailed explanation of why reviewer's suggestions were not followed) within fifteen days upon receiving the communication by the editor.

Proofs: Page-proofs with the revised version will be sent to e-mail the first or corresponding author. Page-proofs *must be returned to the editor, preferentially within 48 hours*. Failure to return the proof promptly may be interpreted as approval with no changes and/or may delay publication. Only necessary corrections in proof will be permitted. Once page proof is sent to the author, further alterations and/or significant additions of text are permitted only at the author's expense or in the form of a brief appendix (note added in proof).

Submission of Manuscripts: Manuscripts should be sent to the **SciELO Submission** (<http://submission.scielo.br/index.php/paz/login>), along with a submission letter explaining the importance or originality of the study. Address and e-mail of the corresponding author must be always updated since it will be used to send the 50 reprints in titled by the authors. Figures, tables and graphics **should not** be inserted in the text. Figures and graphics should be sent in separate files with the following formats: ".JPG" and ".TIF" for figures, and ".XLS" and ".CDR" for graphics, with 300 DPI of minimum resolution. Tables should be placed at the end of the manuscript.

Manuscripts are considered on the understanding that they have not been published or will not appear elsewhere in substantially the same or abbreviated form. The criteria for acceptance of articles are: quality and relevance of research, clarity of text, and compliance with the guidelines for manuscript preparation.

Manuscripts should be written preferentially in English, but texts in Portuguese or Spanish will also be considered. Studies with a broad coverage are encouraged to be submitted in English. All manuscripts should include an abstract and key-words in English and a second abstract and key-words in Portuguese or Spanish.

Authors are requested to pay attention to the instructions concerning the preparation of the manuscripts. Close adherence to the guidelines will expedite processing of the manuscript.

Manuscript Form: Manuscripts should not exceed 150 pages of double-spaced, justified text, with size 12 and source Times New Roman (except for symbols). Page format should be A4 (21 by 29.7 cm), with 3 cm of margins. The pages of the manuscript should be numbered consecutively.

The text should be arranged in the following order: **Title Page, Abstracts with Key-Words, Body of Text, Literature Cited, Tables, Appendices** and **Figure Captions**. Each of these sections should begin on a new page.

(1) **Title Page:** This should include the **Title, Short Title, Author(s) Name(s) and Institutions**. The title should be concise and, where appropriate, should include mention of families and/or higher taxa. Names of new taxa should not be included in titles.

(2) **Abstract:** All papers should have an abstract in **English** and another in **Portuguese or Spanish**. The abstract is of great importance as it may be reproduced elsewhere. It should be in a form intelligible if published alone and should summarize the main facts, ideas, and conclusions of the article. Telegraphic abstracts are strongly discouraged. Include all new taxonomic names for referencing purposes. Abbreviations should be avoided. It should not include references. Abstracts and key-words should not exceed 350 and 5 words, respectively.

(3) **Body of Text:** The main body of the text should include the following sections: **Introduction, Material and Methods, Results, Discussion, Conclusion, Acknowledgments, and References** at end. Primary headings in the text should be in capital letters, in bold and centered. Secondary headings should be in capital and lower case letters, in bold and centered. Tertiary headings should be in capital and lower case letters, in bold and indented at left. In all the cases the text should begin in the following line.

(4) **Literature Cited:** Citations in the text should be given as: Silva (1998) *or* Silva (1998:14-20) *or* Silva (1998: figs. 1, 2) *or* Silva (1998a, b) *or* Silva & Oliveira (1998) *or* (Silva, 1998) *or* (Rangel, 1890; Silva & Oliveira, 1998a, b; Adams, 2000) *or* (Silva, *pers. com.*) *or* (Silva *et al.*, 1998), the latter when the paper has three or more authors. The reference need not be cited when authors and date are given only as authority for a taxonomic name.

(5) **References:** The literature cited should be arranged strictly alphabetically and given in the following format:

• **Journal Article** - Author(s). Year. Article title. *Journal name*, volume: initial page-final page. Names of journals must be spelled out in full.

• **Books** - Author(s). Year. *Book title*. Publisher, Place.

• **Chapters of Books** - Author(s). Year. Chapter title. *In: Author(s) ou Editor(s), Book title*. Publisher, Place, volume, initial page-final page.

• **Dissertations and Theses** - Author(s). Year. *Dissertation title*. (Ph.D. Dissertation). University, Place.

• **Electronic Publications** - Author(s). Year. *Title*. Available at: <electronic address>. Access in: date.

Tables: All tables must be numbered in the same sequence in which they appear in text. Authors are encouraged to indicate where the tables should be placed in the text. They should be comprehensible without reference to the text. Tables should be formatted with vertical (portrait), not horizontal (landscape), rules. In the text, tables should be referred as Table 1, Tables 2 and 4, Tables 2-6. Use "TABLE" in the table heading.

Illustrations: Figures should be numbered consecutively, in the same sequence that they appear in the text. Each illustration of a composite figure should be identified by capital letters and referred in the text as: Fig. 1A, Fig. 1B, for example. When possible, letters should be placed in the left lower corner of each illustration of a composite figure. Hand-written lettering on illustrations is unacceptable. Figures should be mounted in order to minimize blank areas between each illustration. Black and white or color photographs should be digitized in high resolution (300 DPI at least). Use "Fig(s)." for referring to figures in the text, but "FIGURE(S)" in the figure captions and "fig(s)." when referring to figures in another paper.

Responsability: Scientific content and opinions expressed in this publication are sole responsibility of the respective authors.
