ABSTRACT

The present catalogue lists ant (Formicidae) types of the Myrmicinae tribes Dacetini (Acanthognathus and Strumigenys) and Solenopsidini (Allomeurs, Carebarella, Megalomyrmex, Monomorium, Oxyepoecus, Solenopsis, Carebara and Tropidomyrmex) housed in the Formicidae collection of the Laboratório de Hymenoptera, Museu de Zoologia da Universidade de São Paulo/MZSP, Brazil. In total, the collection includes 141 types of these tribes, 41 of the Dacetini (nine holotypes and paratypes, 15 holotypes, 13 paratypes and four syntypes) and 100 of the Solenopsidini (28 holotypes and paratypes, eight holotypes, 29 paratypes, 27 syntypes, four lectotypes and paralectotypes, one lectotype and three paralectotypes), of which 37 and 89 are of still recognized species, respectively. We record label information, condition of the specimens, nomenclatural changes and type status, as well as provide indexes of the listed taxa.

KEY-WORDS: Catalogue; Ants; Types; MZSP; Dacetini; Solenopsidini.

INTRODUCTION

The Formicidae collection housed in the Laboratório de Hymenoptera of the Museu de Zoologia da Universidade de São Paulo/MZSP is one of the most important and representative ant collections for the Neotropical region. This is the case regarding the number of types, species and specimens, as well as geographic coverage (Brandão, 2000), due to the acquisition of the Walter Wolfgang Kempf and Thomaz Borgmeier collections in 1977 (Brandão, 1991). In addition, the collection had also obtained specimens belonging to the collections of Nicolas Kusnezov and

William Mowry Mann. More recently, material has been added by several collaborators, including C.R.F. Brandão (the collection's curator since 1981), his students, and various other museum collaborators and associates (Esteves *et al.*, 2011).

The ant types deposited in MZSP catalogues published thus far include fungus-growing ants (Myrmicinae: Attini) (Klingenberg & Brandão, 2005), Poneromorphs (Amblyoponinae, Ectatomminae, Heteroponerinae, Ponerinae and Proceratiinae) (Scott-Santos *et al.*, 2008), Pseudomyrmecinae (Brandão *et al.*, 2010) and Dorylomorphs (Aenictinae, Ecitoninae, Cerapachyinae and Leptanilloidinae) (Esteves *et al.*, 2011).

The present catalogue deals with Dacetini and Solenopsidini ants, and is the fifth in a series aiming to list all ant types deposited at MZSP. Myrmicinae is a cosmopolite subfamily with the highest local and global species richness (Albuquerque & Brandão, 2004, 2009), including 24 tribes. Dacetini (Forel, 1892: 344) comprises eight genera and 921 recognized species (Bolton, 2012); and Solenopsidini (Forel, 1893: 164) currently includes 20 genera (two *incertae sedis*), 840 species and 133 subspecies (Albuquerque & Brandão, 2004, 2009; Silva *et al.*, 2009; Bolton, 2012; Delsinne *et al.*, 2012), representing two of the largest tribes of the subfamily.

The current situation of the Dacetini tribe deserves a comment. For the classification of ants we follow Bolton (2012), who partially accepted the propositions made by Baroni-Urbani & De Andrade (2007) for Dacetini, adopting the genus *Strumigenys* *sensu* Baroni-Urbani & De Andrade, yet still considering Basicerotini (*Basiceros*, *Eurhopalothrix*, *Octostruma*, *Protalaridris*, *Rhopalothrix* and *Talaridris*) and Phalacromyrmecini (*Phalacromyrmex*) as separate tribes from Dacetini (*Acanthognathus*, *Colobostruma*, *Daceton*, *Epostruma*, *Mesostruma*, *Microdaceton*, *Orectognathus* and *Strumigenys*).

The objective of this catalogue is to provide label information and conservation status of Dacetini and Solenopsidini type specimens in the MZSP, and the current taxonomic status of the species. Our aim is to encourage further studies and also to avoid unnecessary movement of precious, sometimes unique, specimens, as proposed by the International Code of Zoological Nomenclature (1999) about institutional responsibility: “every institution in which name-bearing types are deposited should make them accessible for studies, publish lists of name-bearing types in its possession or custody, and so far as possible, communicate information concerning name-bearing types”.

MATERIAL AND METHODS

For preparation of the catalogue, information from labels related to Dacetini and Solenopsidini ant types deposited at MZSP was compared to the original descriptions – which can be easily found on the Global Ant Project website (<http://gap.entclub.org/taxonomists/index.html>) (Bolton, 2012), the Thomas Borgmeier catalogue and the MZSP catalogue of identifier numbers. The nomenclature of type specimens was updated following the ICBN (1999).

The combination of type names within genera and species are quoted in alphabetical order by last

name, according the genus they are presently organized. We used the following abbreviations: Coll. = collection, Coll. Borgm. = T. Borgmeier Collection, Coll. Kempf = W.W. Kempf Collection, Coll. Mann = W.M. Mann Collection, Coll. Kusn. = N. Kusnezov Collection, M = worker, S = soldier (major worker), G = gyne, M = male, col(s). = collector(s) and leg. = legit. Furthermore, to indicate the conservation status of the type specimens recorded in the present catalogue, we used: A = antenna, W = wing and L = leg. We use A1 for the left antenna and A2 for the right antenna. W1 and W2 representing the anterior and posterior left wings, respectively, and W3 and W4 representing the right wings. L1, L2 and L3 represent the left legs and L4, L5 and L6 the right legs. MP is an abbreviation for Museu Paulista, of which the old Zoological section became the present MZSP in 1939.

In order to record information related to the MZSP Dacetini and Solenopsidini ant types, the following order is adopted in the present catalogue (although we do not have complete information for all entries): species name in the original combination (in alphabetical order by species within genera), author, publication year, page number, posterior taxonomic assignments, type category, number of type specimens of each sex or caste, place of collection, date, collector, original collection name, collection number or collection code and other information. All this information is taken from labels and listed as completely as they appear on the labels, compared with information in the original publication. We also comment on the conservation status of specimens. When appropriate, we indicate broken body parts glued to the paper triangle that holds the type specimen, or the ones lost.

Additional information, present in publications but not recorded on labels, is presented in brackets; for the sake of clarity, we also added further information that we were able to recover from different sources. At the end of each species entry we present, when necessary, the present valid name of the taxon corresponding to the type specimen listed. Finally, we present an index of all the valid names listed in the present catalogue and their respective synonyms or current combinations. The complete information regarding all names listed here can be found in Bolton (2012).

RESULTS

This catalogue includes information on types of 41 nominal species of Dacetini (nine holotypes and paratypes, 15 holotypes, 13 paratypes and four

syntypes) and 100 of Solenopsidini (28 holotypes and paratypes, eight holotypes, 29 paratypes, 27 syntypes, four lectotypes and paralectotypes, one lectotype and three paralectotypes). Dacetin's nominal species include 156 individuals of two genera (54 of *Acanthognathus* and 102 of *Strumigenys*), of which 22 species are still valid, 14 have been already synonymized, three are junior synonyms, one was revived from the synonym and one was renamed by previous authors. There are types of 100 Solenopsidini nominal species, including 770 individuals of the eight genera (46 of *Allomeurus*, three of *Carebarella*, 146 of *Megalomyrmex*, eight of *Monomorium*, 267 of *Oxyepoecus*, 243 of *Solenopsis*, 43 of *Carebara* and 12 of *Tropidomyrmex*), of which 87 belong to still valid species, seven are considered junior synonyms, two were raised to species, one was renamed and three are considered unavailable names by previous authors.

Martiadaguerrei Santschi, 1933: 111. Type[Lectotype]: 1W [Argentina], Provincia Buenos Aires, Rosas F.C. Sud, [$35^{\circ}57'S$, $58^{\circ}56'W$, no date], Juan B. Daguerre [leg.], #1904-666. Missing A2. Combination in *Oxyepoecus* by Ettershank, 1966: 146 and designation of lectotype by Kempf, 1974a: 486.

Monomorium rastratum var. *luederwaldti* Forel, 1913: 219. Syntypes: 12W 1G [Brazil], SP[São Paulo], Salto Grande[Paranapanema River (Lüderwaldt, 1918)], ii.1911, H. Lüderwaldt [leg.], MP[MZSP] #15997. One worker missing A2 funiculus; one worker missing L3 trochanter, femur, tibia and tarsus; dealate gyne. Combination in *Oxyepoecus* by Ettershank, 1966: 146; junior synonym of *O. rastratus* (Mayr, 1887: 615) by Kempf, 1974a: 498. Comment: The MZSP has a specimen labeled with the number #15997, but without information on its type status. As the original description does not mention the precise number of types, we do not consider this last specimen a type.

Oxyepoecus myops Albuquerque & Brandão, 2009: 295. Holotype: 1W Brazil, SP[São Paulo], Salesópolis, EBB[Estação Biológica de Boracéia, $23^{\circ}39'S$, $45^{\circ}53'W$, leaf litter], 5-7.ix.1997[original description says "vii"], C.I. One worker just with gaster; one worker missing A1, A2 last segment of the funiculus, L2/L3/L4/L5 trochanter, femur, tibia and tarsus, L6; both specimens were treated with Barber's fluid.

Solenopsis franki Forel, 1908: 364. Syntypes: 8W [Brazil], SP[São Paulo], S[ão] Paulo, Ypiranga[Ipiranga], 16.ii.1906, J.[L.] Lima col., MP[MZSP] #2354. One worker missing A1/L1; one worker missing head, treated with Barber's fluid; one worker missing A1/A2, L1 tarsus, disarticulated L2 glued on the paper triangle, treated with Barber's fluid. Cotypes[Syntypes]: 4W [Brazil], SP[São Paulo], S[ão] Paulo, Ypiranga[Ipiranga], 16.ii.1906, J.[L.] Lima col., MP[MZSP] #2354. One worker just the postpetiole and gaster. Comment: Original labels of these specimens were associated with new labels, which say "galho seco, aroeira, cupinzeiro" (dry branch, aroeira, termite nest).

Solenopsis franki idae Forel, 1908: 365. Syntypes: 5W 1G, Cotypes[Syntypes]: 4W [Brazil, São Paulo, São Paulo], Ypiranga[Ipiranga, Mata do Governo, 8.x.1906, J.[L.] Lima col., MP[MZSP]

#5578. Dealate gyne missing A1/A2, L1/L2, L3 tibia and tarsus, gaster with a hole in the first tergite, mesonoto with a hole, treated with Barber's fluid. Comment: Original labels of these specimens were associated with new labels, which say "em taquara" (in bamboo).

Solenopsis iheringi Forel, 1908:362. Cotypes[Syntypes]: 8W [Brazil], SP[São Paulo], Estaçao Raiz da Serra, [3.xii.1906], H. Lüderwaldt col., MP[MZSP] #6778. One worker missing A1 funiculus.

Solenopsis invicta Buren, 1972: 9. Holotype: 1W Brazil, MT[Mato Grosso], Cuiabá, Aq. Res. Sta., 16.ii.1971, [W.] Willard & [R.] Willians [leg.]. Paratypes: 15W Brazil, MT[Mato Grosso], Cuiabá, Aq. Res. Sta., 16.ii.1971, [W.] Willard & [R.] Willians [leg.]. One worker missing gaster; one worker missing L3 tibia and tarsus; one worker missing A1 funiculus. 6W Brazil, MT[Mato Grosso], Cuiabá, Victorino's house, 17.ii.1971, [W.] Willard & [R.] Willians [leg.]. 6W Brazil, MT[Mato Grosso], Cuiabá, 18.ii.1971, [W.] Willard & [R.] Willians [leg.]. 3W Brazil, MT[Mato Grosso], Coxim, 9.iii.1971, W.W. Junior synonym of *S. wagneri* Santschi, 1916: 380 by Bolton, 1995: 388; reinstated over *S. wagneri* because of broad usage, according to the ICBN (Shattuck *et al.*, 1999).

Solenopsis joergensei Santschi, 1919: 42. Cotypes[Not types]: 3W [Brazil, Minas Gerais], Pirapora, [vi.1912, E. Garbe, Coll. Borgm.] #2282. Comment: The MZSP has six more specimens with the number #2282 but without cotype label. Furthermore, the original description was based on specimens collected in Provincia Formosa, Argentina. So, we do not consider them as types.

Solenopsis leptanilloides Santschi, 1925a: 159. Cotype[Syntype]: 1W Argentina, [Provincia Santa Fe], Rosario, [no date, Jose Hubrich leg., Coll. Borgm.] #3825.

Solenopsis nigella st. *prevalens* Santschi, 1923: 257. Cotypes[Syntypes]: 2W [Argentina], Buenos Aires, Sierra Ventana, [C.] Bruch [leg.], Coll. Borgm. #3824. Junior synonym of *S. nigella gensterblumi* Forel, 1901: 298 by Creighton, 1930: 132.

Solenopsis photophila Santschi, 1923: 250. Cotype[Syntype]: 1W Argentina, Villaguay,

[C.] Bruch [leg., Coll. Borgm.] #3829. Missing gaster.

Solenopsis pulleni Moreno & Mackay, 2001: 62. Paratype: 1W [United States of America], NM[New Mexico], Doñia Ana Co[County], Las Cruces, Jornada Playa, 8.x.1986, B. Pullen [leg.], #10. Comment: Unavailable name by Bolton, 2012.

Solenopsis reichenspergeri Santschi, 1923: 256. Cotype[Syntype]: 1W Brasil, Rio [de Janeiro, A.] Reichensperger, [Coll. Borgm.] #3833. Missing L3 trochanter, femur, tibia and tarsus.

Solenopsis succinea r. *nicai* Forel, 1913: 222. Cotypes[Not types]: 2W 3G 3M [Brazil], Est[ado de] S[ão] Paulo, Franca, [ii.1911, E. Garbe leg., MZSP] #15898. One worker just with postpetiole and gaster. [Syntypes]: 6W, [Not types]: 2M [Brazil, São Paulo, Franca, xii.1910, E. Garbe, MZSP] #15892. One worker missing petiole and postpetiole; one worker missing A1; one male missing A1 last segment of the funiculus, L2/L3 trochanter, femur, tibia and tarsus. Cotypes[Syntypes]: 10W [Brazil], SP[São Paulo], Franca, [xii.1910, E.] Garbe [leg.], Coll. Borgm. #2123. One worker treated with Barber's fluid. Comment: The original paper describes only workers with the number #15892. Specimens from type series were sent to Borgmeier and received the number #2123. So the males #15892 and the specimens with the number #15898 are not types.

Solenopsis stricta st. *foederata* Santschi, 1923: 255. Cotypes[Syntypes]: 5W Brésil[Brazil, Santa Catarina], Blumenau, [no date, P.M.] Witte [leg.], Coll. Borgm. #3830. One worker just with postpetiole and gaster.

Solenopsis stricta st. *foederata* var. *specularis* Santschi, 1923: 256. Cotypes[Syntypes]: 2W Brésil[Brazil, Santa Catarina], Blumenau, [no date, P.M.] Witte [leg.], Coll. Borgm. #3831. One worker missing A1 funiculus; One worker missing A1 last segment of the funiculus, L3 trochanter, femur, tibia and tarsus. Unavailable name by Bolton, 1995: 391.

Solenopsis tridens Forel, 1911: 298. Syntypes: 3W [Brazil], BA[Bahia], Vila Nova["Vila nova = Bonfim" (Kempf, 1971), today named Senhor do Bonfim. "In the region of Caatingas" (Ihering & Ihering, 1911)], ii.1908, E. Garbe [leg.], MP[MZSP] #14211, Coll. Borgm. #2128. One worker missing head, L4 tibia and tarsus. Cotypes[Syntypes]: 6W [Brazil], Est[ado da] Bahia, Villa Nova[Senhor do Bonfim, ii.1908, E. Garbe leg.], MP[MZSP] #14211.

Solenopsis tridens var. *substituta* Santschi, 1925b: 236. Syntypes: 3W 3G [Brazil], SP[São Paulo], Pitangueiras, i.1925, [H. Lüderwaldt leg.], Coll. Borgm. #326. One worker missing head, L4 tibia and tarsus; dealate gyne; one gyne missing W2; one gyne missing W1/W3. Raised to species by Trager, 1991: 161. Comment: Santschi (1925b) referred to these specimens with the identifier number #20909, but according the MZSP catalogue of identifier numbers the specimen #20909 is a Chrysomelidae and the correct number for the syntypes is #20907. Besides that, specimens from type series were sent to Borgmeier and received the number #326.

Solenopsis (Diplorhoptrum) subterranea MacKay & Vinson, 1989, 175. Paratypes: 3W [United States of America], TX[Texas], Brazos Co[County], 10 km N[orth] Kurten, 5.v.[19]87, W. Mackay [leg.], #9149. One worker missing L3 trochanter, femur, tibia and tarsus. 6W [United States of America], TX[Texas], Brazos Co[County], 10 km N[orth] Kurten, 5.viii.1987, W. Mackay [leg.], #9636. One worker missing L1/L3 femur, tibia and tarsus, L2 last tarsus.

RESUMO

O presente catálogo lista os espécimes-tipo de espécies de formigas (Formicidae) das tribos de Myrmicinae Dacetini (Acanthognathus e Strumigenys) e Solenopsidini (Allomeurs, Carebarella, Megalomyrmex, Monomorium, Oxyepoecus, Solenopsis, Carebara e Tropidomyrmex) depositados na coleção de Formicidae do Laboratório de Hymenoptera do Museu de Zoologia da Universidade de São Paulo/MZSP, Brasil. No total, a coleção inclui 141 tipos destas tribos, sendo 41 de espécies de Dacetini (nove holótipos e parátipos, 15 holótipos,

13 parátipos e quatro síntipos) e 100 de Solenopsidini (28 holóticos e parátipos, oito holóticos, 29 parátipos, 27 síntipos, four lectóticos e paralectóticos, um lectótico e três paralectóticos), das quais 37 e 89 ainda são ainda reconhecidas, respectivamente. São apresentados os dados de rótulos, estado de conservação dos exemplares, alterações nomenclaturais, status taxonómico e índices para os táxons catalogados.

PALAVRAS-CHAVE: Catálogo; Formigas; Tipos; MZSP; Dacetini; Solenopsidini.
